CONTINUED OPERATION OF A RAINGAGE NETWORK FOR COLLECTION, REDUCTION, AND ANALYSIS OF PRECIPITATION DATA FOR LAKE MICHIGAN DIVERSION ACCOUNTING: WATER YEAR 1992

1. INTRODUCTION

The volume of water diverted from Lake Michigan into the State of Illinois is monitored to ensure that the diversion does not exceed a long-term average of 3,200 cubic feet per second (cfs) as imposed by a U.S. Supreme Court Order of 1967, and updated in 1980. This diversion has a long history, dating back to the mid-1800s with the completion of the Illinois and Michigan Canal. Over the years, it has been affected by such events as the reversal of the flow of the Chicago River and completion of the Chicago Sanitary and Ship Canal in 1901, and has weathered various legal proceedings that attempted to ensure that the diversion could be monitored and did not exceed certain limits. One of the key components of the monitoring procedure, administered by the U.S. Army Corps of Engineers (COE), Chicago District, is the accurate representation of the precipitation that falls over portions of the Cook County, Illinois, region.

The primary components of Illinois' diversion from Lake Michigan are as follows: (1) water is pumped directly from Lake Michigan as the source of potable water supply and discharged into the river and canal system in the greater Chicago area as treated sewage; (2) storm runoff is discharged from the diverted watershed area of Lake Michigan, draining to the river and canal system; and (3) water enters the river and canal system directly from Lake Michigan.

The storm runoff from the Lake Michigan watershed basin enters the combined sewer systems and watercourses. The combined sewers mix sanitary systems with the runoff, and this water then goes to the treatment plants or, during major flood events, becomes surcharge into the watercourses. When large storm events are predicted (and greater than normal storm runoff is anticipated), the canal system is drawn down prior to the event to prevent flooding. If the event fails to materialize, canal system levels are restored using a direct diversion from Lake Michigan through one of three facilities located along the shoreline: the Chicago River Controlling Works, O'Brien Lock and Dam, or the Wilmette Controlling Works.

There are two methods by which diversion is computed. The first method involves the direct measurement of diversion flow at Romeoville, Illinois, as measured by an acoustic velocity meter. Flow at Romeoville consists of both diversion and nondiversion flows (deductions). The theory behind diversion accounting is to use the flow at Romeoville and deduct from it flows not attributable to diversion. Diversion flows that bypass Romeoville are added to the resultant flow, yielding a net computed diversion of water from Lake Michigan. The deductions to the Romeoville record include runoff from 217 square miles of the Des Plaines River watershed that is discharged into the canal, groundwater supply whose effluent is discharged into the canal, and Indiana water supply that is discharged into the canal via the Calumet River system and the Calumet Sag Channel.

The second method estimates diversion by adding the Lake Michigan water supply pumpage, direct diversions from Lake Michigan, and runoff from 673 square miles of diverted Lake Michigan watershed. This computation is performed to cross-check the first method.

In both of these procedures, it is necessary to estimate runoff from the Des Plaines River and the Lake Michigan watersheds. Since a significant portion of this area is not gaged with

respect to water flows, runoff is estimated through hydrologic simulation. Inputs into the simulation model consist of land-use and climatological data. Of the latter, the **most** significant is precipitation data.

Accurate precipitation data, thus, are essential to properly simulate the runoff process. Runoff can constitute a significant portion of the diversion. For example, in Water Year 1984 (a water year extends from October 1 through September 30 of the following calendar year), runoff from the Des Plaines River watershed constituted a 196.5 cfs (5 percent) deduction from the Romeoville measurement record in the diversion computations. In the verification computations, the Lake Michigan watershed runoff constituted an 829.0 cfs (27 percent) deduction from the total diversion.

However, the precipitation data available for use by the accounting procedure prior to Water Year 1990 (particularly Water Years 1984-1989) have displayed patterns inconsistent with known, long-term Chicago-area patterns (e.g., Changnon, 1961, 1968; Huff and Changnon, 1973; Vogel, 1988, 1989; Peppier, 1990, 1991a, 1993). These patterns also diverge from the known urban effects found within the precipitation patterns for the Cook County region for heavier rainfall distributions from 1949-1974 (Huff and Vogel, 1976), particularly towards the south, and within patterns observed during the operation of a dense raingage network and radar system in the Chicago area during the late 1970s (Changnon, 1980, 1984).

The recent unusual patterns were caused by abnormally low precipitation totals at a select number of the 13 sites used by the accounting procedure (Figure 1). Inspection of these sites (Vogel, 1988), which are irregularly distributed over the region, revealed that the low precipitation totals were caused by 1) inadequate raingage exposure (e.g., gages situated on rooftops or too near natural or artificial, flow-restricting obstructions) and 2) different observing,

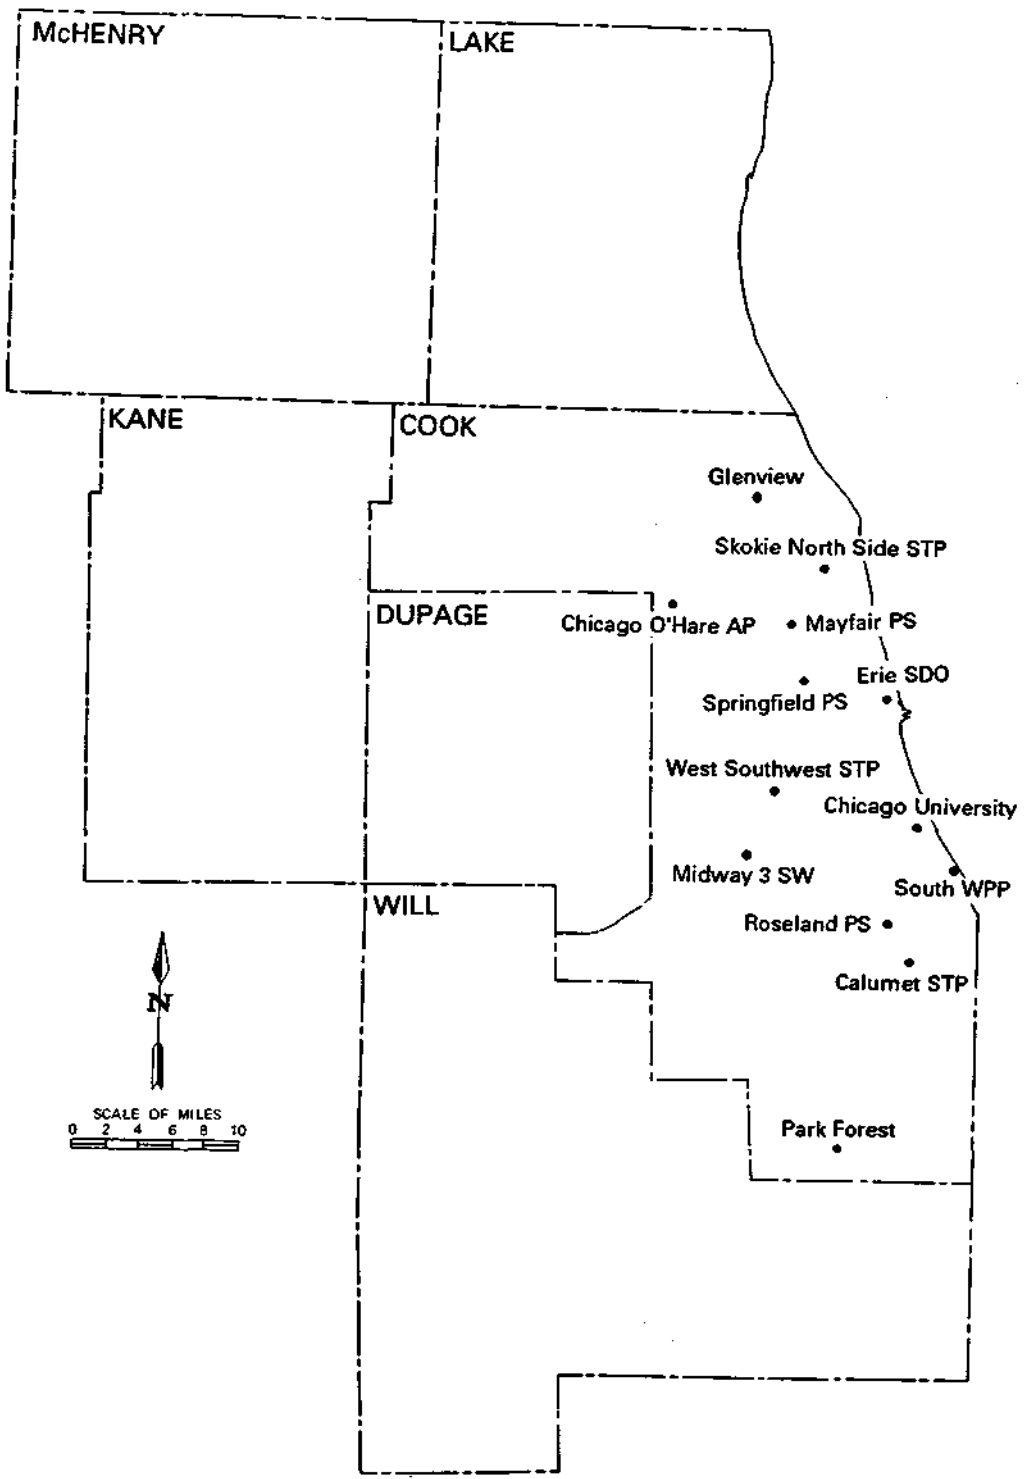

Figure 1. Raingage locations used for diversion accounting purposes prior to Water Year 1990. These include the National Weather Service gages located at Chicago O'Hare AP, Midway 3 SW, Chicago University, and Park Forest, the City of Chicago gages at Mayfair PS, Springfield PS, South WPP, and Roseland PS, and the Metropolitan Water Reclamation District of Greater Chicago gages at Glenview, Skokie North Side STP, Erie SDO, West Southwest STP, and Calumet STP. Abbreviations are as follows: AP = Airport, SW = Southwest, PS = Pumping Station, WPP = Water Purification Plant, STP = Sewage Treatment Plant, and SDO = Sanitary District Office.

data reduction, and quality control practices used by the individual groups responsible for raingage operation and data collection (National Weather Service - NWS, Metropolitan Water Reclamation District of Greater Chicago - MWRDGC, and City of Chicago - CC). Vogel (1988) established that the unusual precipitation patterns began occurring in the late 1960s when some changes were made in data collection and reduction.

Vogel (1988) devised a procedure to adjust the questionable values, thus making the data suitable for use in the accounting procedure. This procedure, however, is tedious to implement, and the adjusted precipitation values may not completely capture the actual precipitation regime, although the data produced are much-improved over the original values. This procedure also illuminated difficulties experienced when trying to merge data observations from different observing agencies and equipment into one data set. Vogel (1988) gave the following recommendation at the end of his report on the reduction and adjustment of the Water Year 1984 data and on field evaluations of the NWS, MWRDGC, and CC sites:

> With these types of differences it will always be hard to maintain a *consistent* set of high-quality precipitation observations for the Chicago urban region. A precipitation network which must produce a set of high-quality observations should have a consistent set of gages; should be managed by one group with fixed quality control procedures, exposure criteria, and a set operating procedure. Management by one group would allow for consistent 1) observations, 2) quality control, and 3) spatial and temporal precipitation patterns.
>
> To achieve this, it is recommended that a raingage network be established to monitor the precipitation over northeast Illinois relevant to the diversion of Lake Michigan waters. This network should consist of 10 to 15 weighing-bucket recording raingages. The raingages should be reasonably spaced across the affected area. The network should be managed by one group to ensure that the best possible exposures are obtained initially, and that these exposures are inspected at least annually. The data from such a network should all be quality-controlled in a consistent manner.

> Weighing-bucket raingages with daily charts would be capable of obtaining hourly or smaller time increments if daily charts are used. To reduce costs and to increase security, it is recommended that these raingages be located on private property, and that the observers be given a modest annual stipend. The charts from the observers should be mailed to a central location for data processing, quality control, and extraction of hourly precipitation totals. Raingages should be evenly spaced, as much as possible, and sites would be found after consulting with the agencies involved (pp. 41-42).

Using Vogel's recommendation as a model, the State Water Survey (SWS) and the COE jointly decided in late 1988 to devise, install, and operate a new raingage network, funded by the COE. The purpose of the new network was to produce consistent, accurate data for the diversion accounting, which would require little or no adjustment. The implementation and operation of such a network would have to be justified on the grounds of both long-term cost savings and greater accuracy. This report describes the maintenance and operation of the network, along with the data reduction and analysis techniques employed, and brief data analyses, for Water Year 1992, the third year of the operation of the network.

2. NETWORK DESIGN

The SWS has operated dense raingage networks in the past (e.g., Huff, 1970, 1979), which tested gridded raingage spacings of 6 feet to 6 miles. Adequate sampling of convective-type precipitation (spring and summer) was found to require nearly twice as many gages as required by more widespread, continuous precipitation (fall and winter). With that in mind, and opting for an optimum grid spacing, an initial attempt at creating a grid resulted in an array of 40 raingages located in the Cook County region within the Lake Michigan and Des Plaines River watersheds of the MWRDGC North, Central, South, and Lemont basins. Due to cost

considerations, however, some spring/summer catchment ability was sacrificed, and a 25-site grid was devised using a 5-7 mile grid spacing between gages. Also due to cost considerations, raingages were not installed outside the watershed boundaries to better define isohyetal patterns at those boundaries. These 25 raingages, more than Vogel had originally envisioned (10-15), have provided adequate coverage for precipitation catchment during Water Years 1990 and 1991, the first two years of operation of the network (Peppier 1991b, 1991c), and are consistent with the "best current engineering practice" as specified in the 1967 Supreme Court decree.

Topographic maps of the Cook County region were used to approximate the location of each of the 25 sites and fine-tune their placement to best position the sites with respect to residential areas, industrial facilities, or municipal grounds. Since terrain effects are fairly minimal in northeastern Illinois, gridding was possible. Gridding also allows the use of simple arithmetic averaging to compute areal depths instead of other labor-intensive methods such as the Thiessen polygonal method. Once candidate locations were found, several preliminary field trips were made to the Cook County region, and letters were written by the SWS in summer 1989 seeking permission to use the selected locations as raingage sites. Due to the urbanization of the region, site selection was sometimes a frustrating venture, as it was difficult in many instances to identify good catchment areas free of barriers for ground-level placement. When selecting sites, highest priority was given to those at ground level in relatively open, secure areas since obstructions and local wind eddies produced by flow barriers present the largest sources of error in collecting precipitation data. Placing the collector at ground level mitigates wind effects on catchment and represents the ideal exposure (Legates and Willmott, 1990), but it is not practical in wintertime when snow is measured. Thus, as has been standard SWS practice, each raingage was placed on stakes with its base approximately 8 inches above ground level and

the top of its orifice at about 4 feet. When asked for permission to site a raingage on their property, most individuals, businesses, and municipalities were extremely receptive. In fact, only four sites have been relocated since the network began operating in October 1989.

In late September and early October 1989, the entire 25-gage network was installed (Figure 2). Each universal weighing-bucket raingage used throughout the network was fitted with a battery-powered electric chart drive for more consistent and reliable operation. The SWS provided all raingages from its inventory. Table 1 lists the property owner and address for each site. Appendix I contains more complete site descriptions for each network location as of September 30, 1992.

The weighing-bucket recording raingages used are as reliable as any others available (see Jones, 1969, for a complete description of tests of different raingages). All raingages are subject to catchment errors due to winds, wetting losses, evaporation, splashing into or out of the gage, and blowing snow (Legates and Willmott, 1990). Koschmieder (1934) noted that as wind speed increases, gage catch decreases. Legates and Willmott (1990) found that raingage errors "tend to be proportional to total precipitation and amount to nearly 11 percent of the catch." To prevent loss due to blowing snow during the winter, the Nipher shield and the shield used by Lindroth (1991) are helpful but were not considered for the new network due to cost and vandalism considerations.

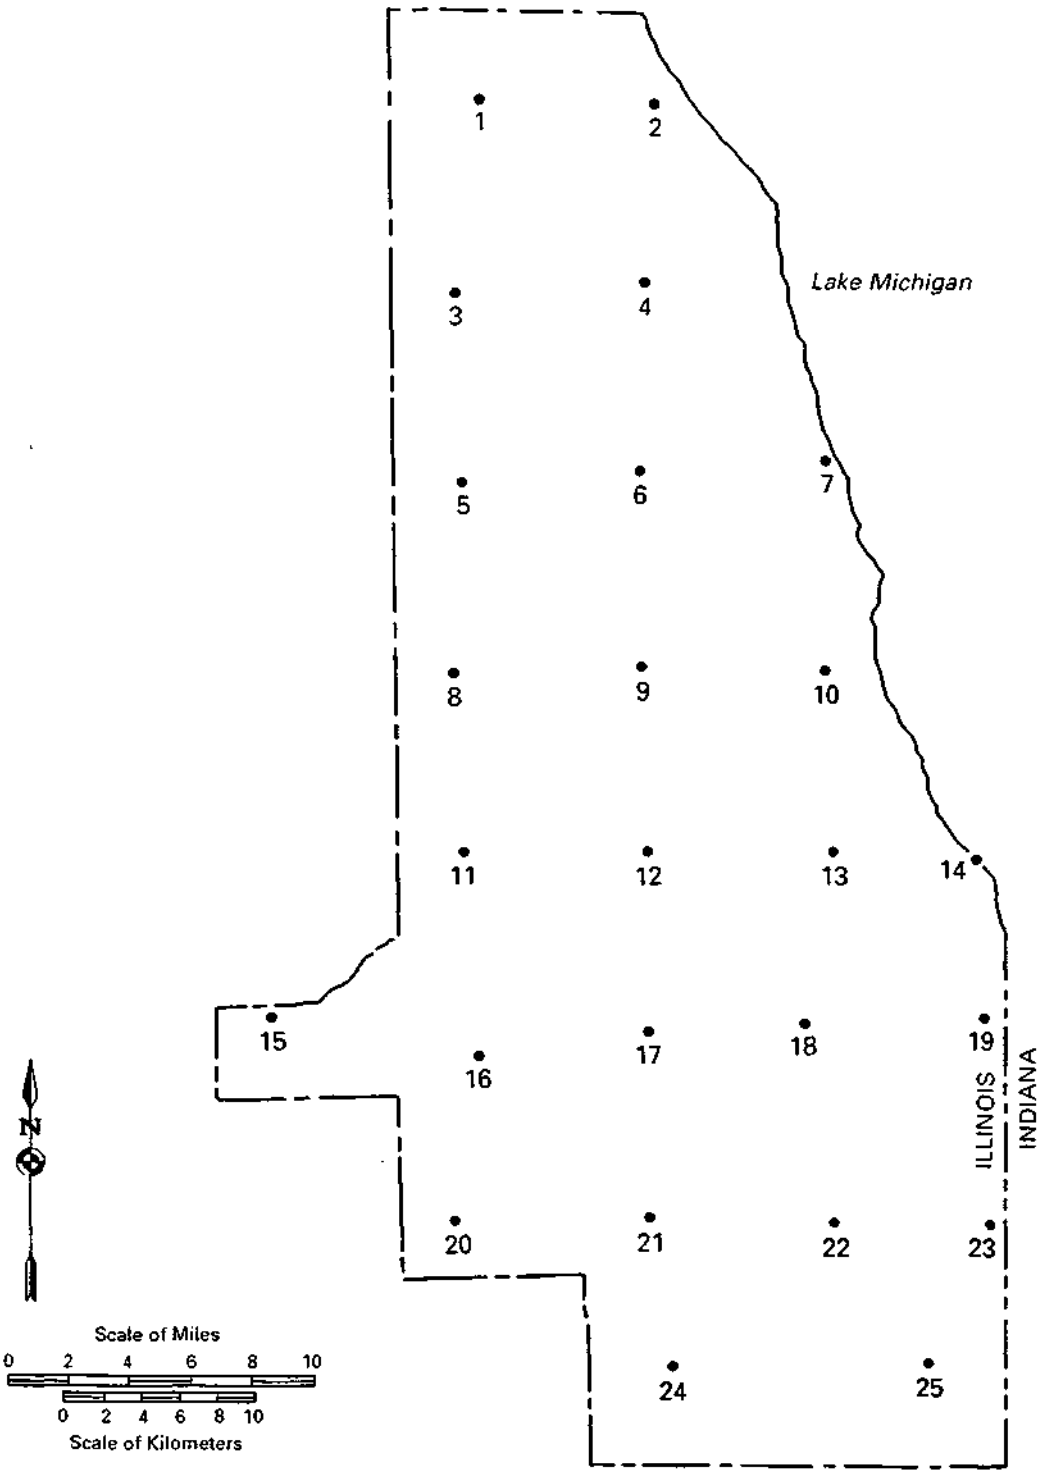

Figure 2. Configuration of the current 25-site raingage network used during Water Years 1990-1992.

3. NETWORK OPERATION AND MAINTENANCE

Each raingage in the network was fitted with 24-hour chart drive and chart cylinder gears that rotate the chart cylinder once every 24 hours. The 24-hour chart allows resolution down to 15-minute periods. Because a chart can measure up to 12 inches of precipitation, each gage is fitted with a galvanized bucket capable of holding 12 inches of precipitation in calibration with the 8-inch orifice opening used on the raingage collector. An upward pen traverse on a chart measures the first 6 inches the bucket catches, and a reversed, downward pen traverse measures inches 7-12. The latter traverse, often unnecessary, is vital whenever more than 6 inches of precipitation occurs between chart periods, or during winter when the antifreeze-charged buckets are allowed to accumulate precipitation without dumping for long periods of time.

A single team of observers, living in Cook County, services each gage every 6-8 days, which means that 6-8 traces are drawn on each chart. Servicing includes removing and replacing the current chart, re-inking the pen, dumping the bucket from April-October (the warm season of the year), and noting any problems, including chart-drive malfunction, gage imbalance or instability, vandalism, unauthorized movement of the gage, etc. During the warm season, evaporation shields are fitted into the collection orifice above the bucket to mitigate evaporation. During the cool season (November-March), these shields are removed and a 1-quart charge of antifreeze is added to each bucket. This allows frozen precipitation to melt in the bucket as it is caught, allowing the weighing mechanism to give a proper reading. Refer to Appendix II for a complete listing of servicing instructions provided to the raingage observers.

Each week a complete set of 25 charts collected by the observers is mailed to the SWS, along with notations about problems. The following section, describing data reduction, explains what happens to the data collected on the charts.

Approximately once every two months, or as necessary, the SWS project leader visits the network to perform routine maintenance and repairs for which the observers do not possess adequate expertise. These activities include a site assessment of an observer-noted problem and the determination of a solution. Because most problems pertain to the chart drives, the solution is often to replace the drive or its batteries. If replaced, a chart drive is cleaned and readied for re-use at the SWS. Two spare chart drives allow for flexibility here. Other typical problems (mentioned above) can be solved on these trips as well. A complete maintenance history, including site relocations, is given for each of the 25 raingages in Appendix III, which more fully describes the kinds of maintenance and repairs conducted. This information is current through September 30, 1992.

4. DATA REDUCTION

When a set of charts arrives at the SWS, it is edited to identify the various traces on the charts and to number those showing precipitation sequentially by date. This is perhaps the most important step in the reduction procedure. A running inventory of "on" and "off chart times is also maintained to ensure that the on-times on the newly received charts match the off-times on the last set of charts analyzed. Occasionally, the observers make inadvertent errors in the on-/off-time designations, particularly when time zones change in October and March (charts are always kept on Central Standard Time). The on- and off-times are marked on the charts, with the on-time revolution designated as "1", and the last revolution designated as appropriate. Then, the various rain periods (storms) are identified and numbered based on their sequence in relation to the first and last revolutions. This editing procedure also acts as a trouble-shooting exercise to identify chart-drive problems (running slow, fast, or not at all). Raingage instability

problems can also be identified from a shaky pen trace. Skipping or unusually heavy traces indicate problems with the pen tip. Calibration problems can be noted if a trace reverses before the 6-inch line is reached. Finally, the editing stage permits the identification of missing periods of data on the charts, and these are appropriately marked. After all charts have been edited, they are ready to be digitized with a Summagraphics Microgrid II digitizer.

All data values are fed into a 486/33 MHz personal computer. Each chart is processed separately. The four corners of a chart are digitized to set the grid, then on- and off-times are entered and their locations digitized. The number of revolutions on each chart is noted. Each trace indicating precipitation is digitized by "clicking-in" each breakpoint along the respective trace. Once a chart is digitized, a computer output gives details on the precipitation that was measured on the chart, in storm amount format, with appropriate beginning and ending times. Also included is an analysis of whether the chart drive is running slow or fast, which helps assess whether a chart drive requires servicing. Errors made during the editing stage can also be caught during digitization. If a chart drive stops during a collection period, the beginning and ending points of the missing period are digitized and appropriately stored in the computer.

Once a calendar month of data is logged into the computer, a C-language program, written at the SWS, calculates hourly precipitation values at all 25 sites for each hour of the month in question. These calculations are based on a linear interpolation between digitized breakpoints on the traces. The newly computed hourly values are compared to the digitized storm values during program execution to ensure consistent precipitation amounts. A printout of the entire monthly data array contains data for all 25 stations for all hours of the month. Monthly totals appear at the bottom of the print out. Missing values are denoted as 99.99.

This data array is then used to check for time and space consistency, to divide the data into storm periods, and to fill in missing values with interpolated information. A storm is defined as a precipitation period separated from preceding and succeeding precipitation periods by approximately 6 hours at all stations in the network. This definition has been used by Huff (1967) for an area of similar dimensions in central Illinois, by Vogel (1986) to define extreme storm events in the Chicago area, and by Vogel (1988, 1989) and Peppier (1990, 1991a, 1991b, 1991c) to define storms for Water Years 1984-1991. For each storm, values are summed and plotted on maps using all available data and stations, and isohyetal patterns are drawn. During Water Year 1992, 123 such storms were defined.

After a generalized precipitation pattern is obtained for each storm, interpolated storm totals are manually estimated from the pattern for each site having missing information during that storm. Wind information, if available (usually the resultant direction and speed at Chicago O'Hare Airport), and known urban effects in the Chicago area (Huff and Vogel, 1976; Changnon, 1980, 1984) are taken into account when drawing isolines and interpolating values. A computer program is then executed, which uses an objective analysis program from the International Mathematical and Statistical Library (IMSL) to objectively determine new values for hours designated as missing. The objective routine is also used to re-create values at data sites with questionable values that were identified during the storm analysis stage. After execution of the program, the new values are compared to the manually estimated ones, and any unrealistic objective values are adjusted. Once everything has been verified, a final computer file of hourly precipitation values for the month being analyzed is archived.

5. DATA ANALYSIS AND METHODOLOGIES

Using the final Water Year 1992 data set, various analyses were produced. These include: (1) a water year amount plot (Figure 3) and monthly amount plots (Figures 4-9) for the region as documentation of the data collected from the network, (2) monthly and water year totals at all sites (Table 2), (3) comparisons to patterns from Water Years 1984-1985 and 1987-1989 (Figure 10) and 1990-1991 (Figure 11), and (4) an analysis of the three-year network precipitation average, 1990-1992 (Figure 12).

Figure 3 contains the complete Water Year 1992 analysis (see also Table 2 for exact values). Isopleths are labeled in inches of precipitation. During this water year, precipitation amount highs occurred in the east-central and southwestern portions of the Cook County region, centered on Sites #10 (26th Street) and #15 (MWRDGC-Lemont). Precipitation lows were generally located in the northwestern, western, and extreme southeastern portions of the region, centered on Sites #3 (Des Plaines), #8 (Westchester), and #25 (Chicago Heights), respectively. The general north-to-south increase in precipitation noted during past network water years (1990-1991) was not evident in Water Year 1992 (e.g., Peppier 1991b), and values in general for this water year were less widespread (much less in some cases) than for the other network water years.

Some areas within the network deserve further mention. An area of higher precipitation stretching from Site #10 northwestward to near Site #6 (near Belmont Avenue) coincides with the urban high noted by historical 1949-1974 data (e.g., "north-central high" from Huff and Vogel, 1976) and by data from other water years in the 1980s and 1990s (e.g., Peppier, 1991a, 1991b, 1991c). The stabilizing effect exerted by Lake Michigan on convective rainfall (e.g., Huff and Vogel, 1976), resulting in lower values along the lake, was not strongly evident during

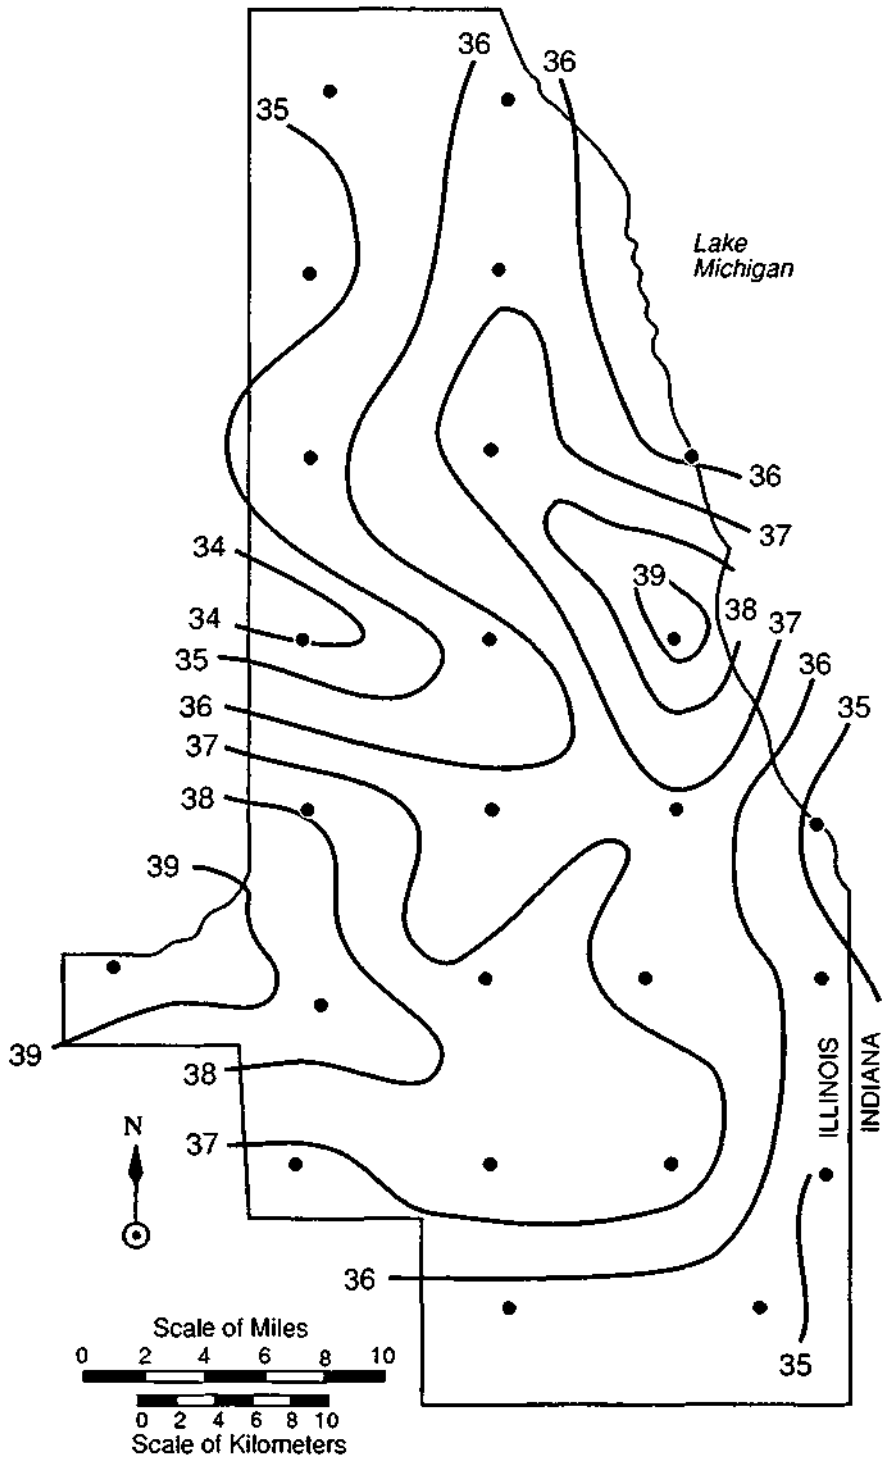

Figure 3. Precipitation pattern (inches) for Water Year 1992. Dots indicate raingage sites.

this water year. However, the western minimum appears similar to adjusted ones found in some water years during the 1980s (Peppier, 1991a), and the southeastern minimum resembles those of Water Years 1990 and 1991. As mentioned above, the 1992 pattern has less in common with the patterns for 1990 and 1991 than those two patterns had with each other. The early-spring drought of 1992 may be responsible for the lighter water year values as a whole, and for the changes in the precipitation pattern documented. In Water Year 1990, totals ranged from 36.24 inches at Site #4 (Skokie) to 45.89 inches at Site #13 (near 75th Street), and during 1991 the totals ranged from 33.79 inches at Site #1 (Mission Brook Sanitary District) to 47.54 inches at Site #24 (Matteson). For Water Year 1992, totals ranged from 33.63 inches at Site #8 (Westchester) to 40.00 inches at Site #10 (26th Street) and 39.83 at Site #15 (Lemont). Like the network 1990 and 1991 patterns, the pattern for Water Year 1992 is in great contrast to the unusual anomalies associated with the precipitation amounts from the NWS, MWRDGC, and CC raingages used to generate precipitation information for Water Years 1984-1989.

Figures 4-9 contain monthly analyses during Water Year 1992 (see also Table 2). Generally, light precipitation occurred during the winter (December-February), as in other water years. Precipitation was also extremely light during the spring (April-June), a normally wet period marked by a drought throughout Illinois and the Midwest in 1992. Indeed, May was the driest month during the water year. The heaviest precipitation amounts occurred during the fall (October-November) and summer (July-September), the latter breaking the spring drought. October was by far the wettest month of the water year. Looking at some of the more interesting light precipitation cases, May, the driest month, had amounts ranging from just 0.08 inches at Site #15 (Lemont), the water year low, to 1.05 inches at Site #23 (Lansing). January was the second-driest month, with precipitation ranging from just 0.73 inches at Site #20 (Orland

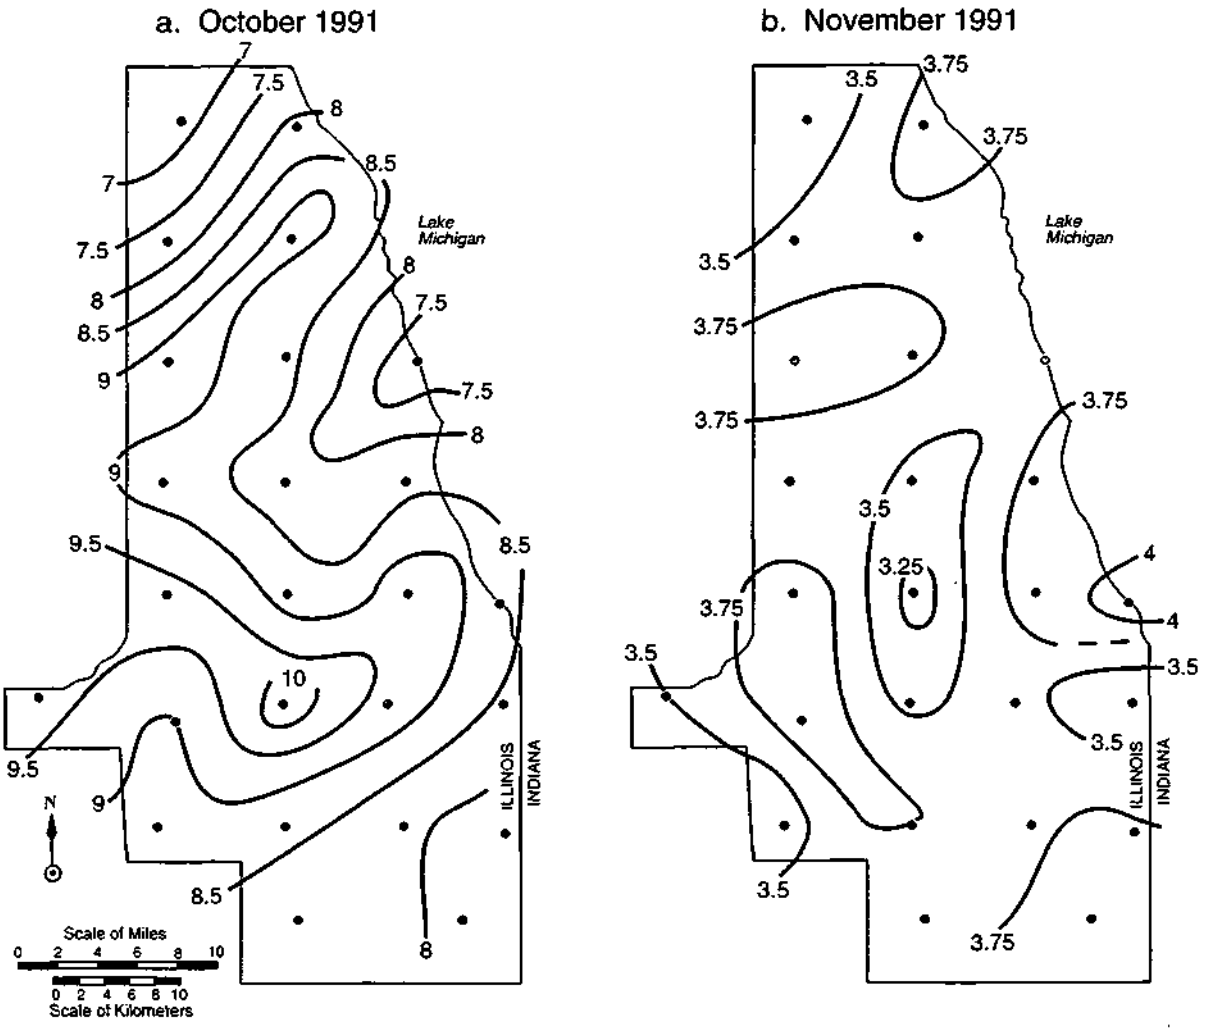

Figure 4. Precipitation pattern (inches) for October 1991 (Panel a) and November 1991 (Panel b). Dots indicate raingage sites.

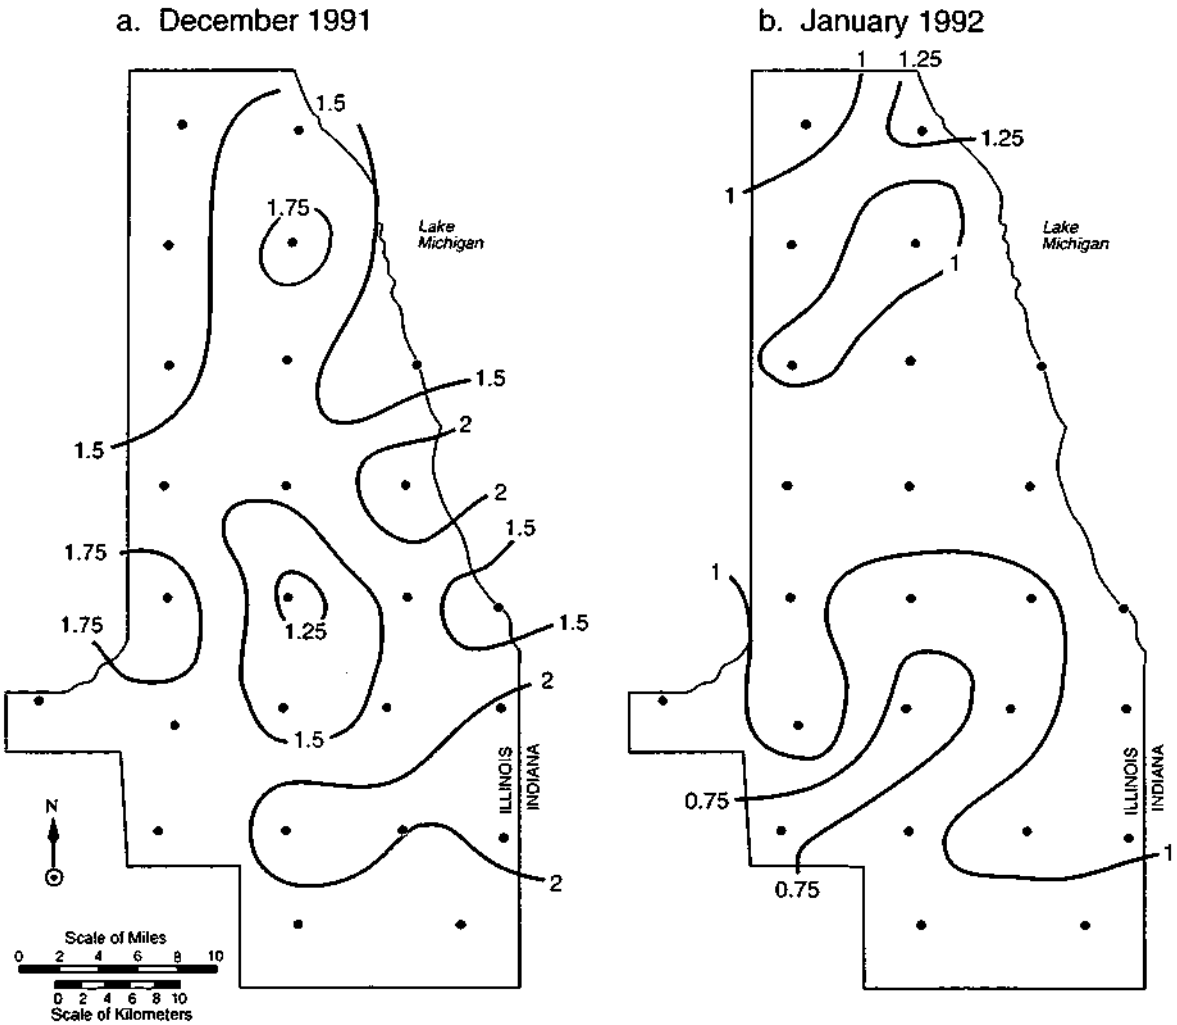

Figure 5. Precipitation pattern (inches) for December 1991 (Panel a) and January 1992 (Panel b). Dots indicate raingage sites.

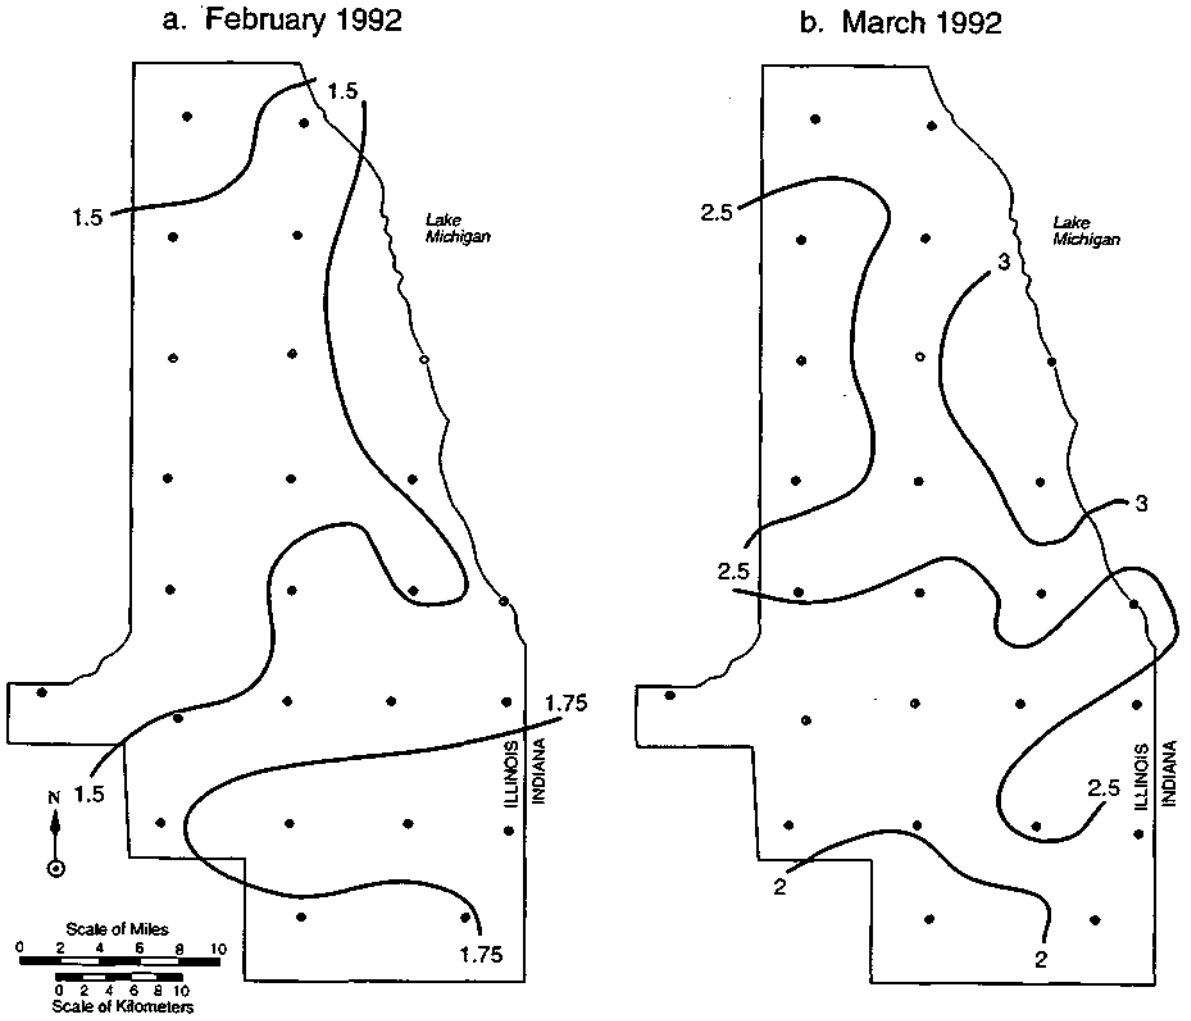

Figure 6. Precipitation pattern (inches) for February 1992 (Panel a) and March 1992 (Panel b). Dots indicate raingage sites.

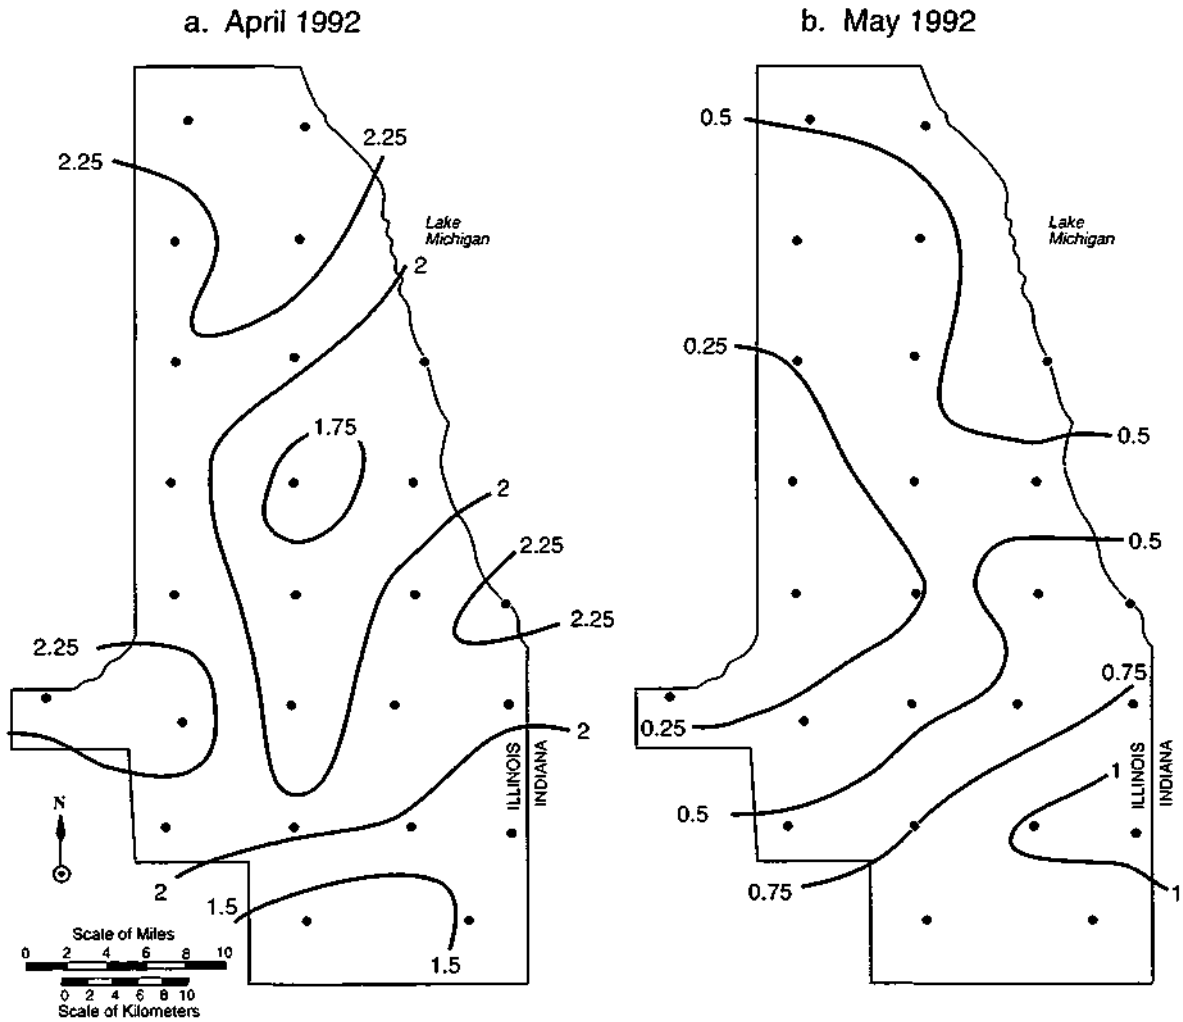

Figure 7. Precipitation pattern (inches) for April 1992 (Panel a) and May 1992 (Panel b). Dots indicate raingage sites.

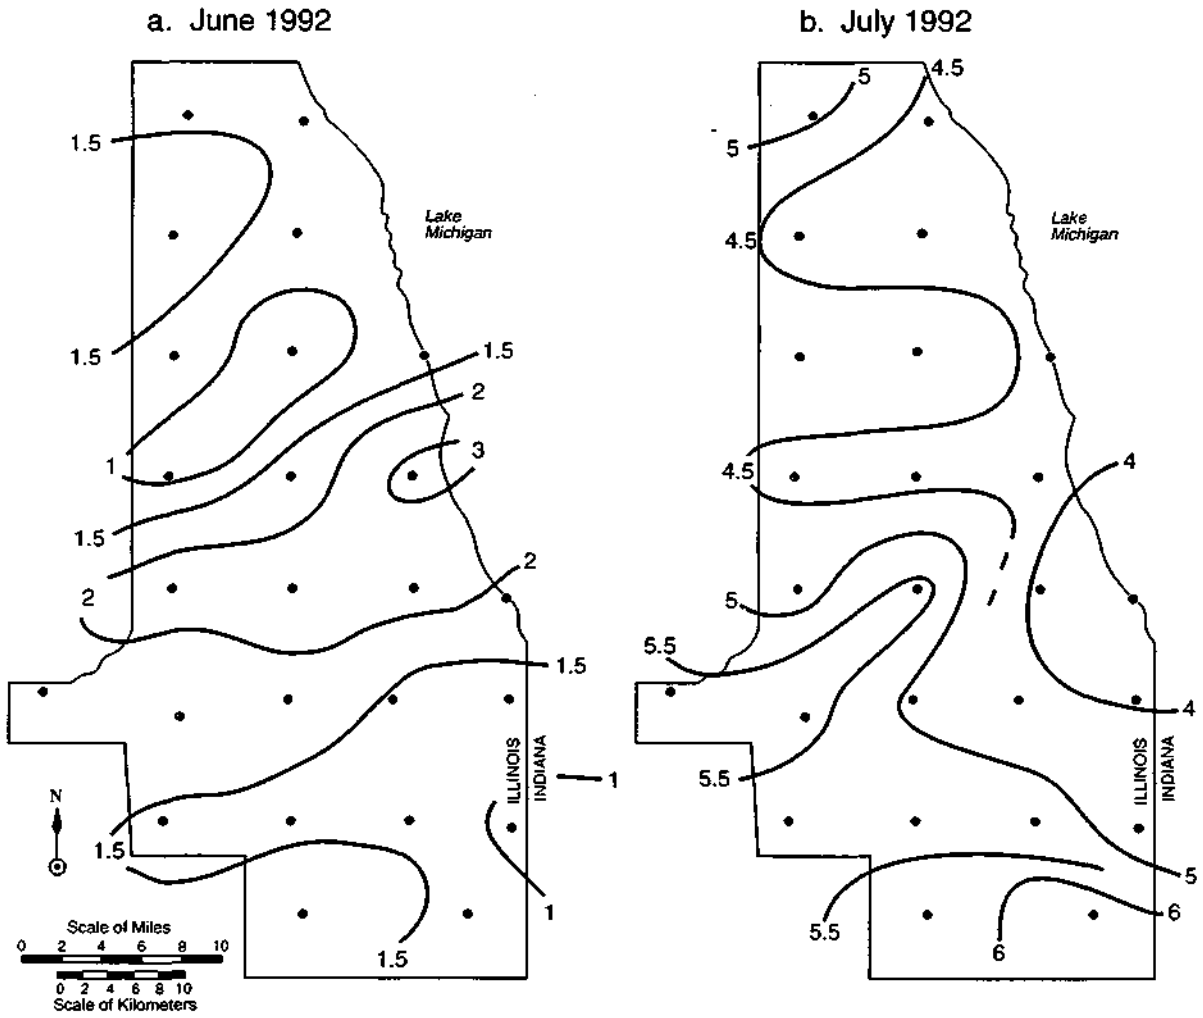

Figure 8. Precipitation pattern (inches) for June 1992 (Panel a) and July 1992 (Panel b). Dots indicate raingage sites.

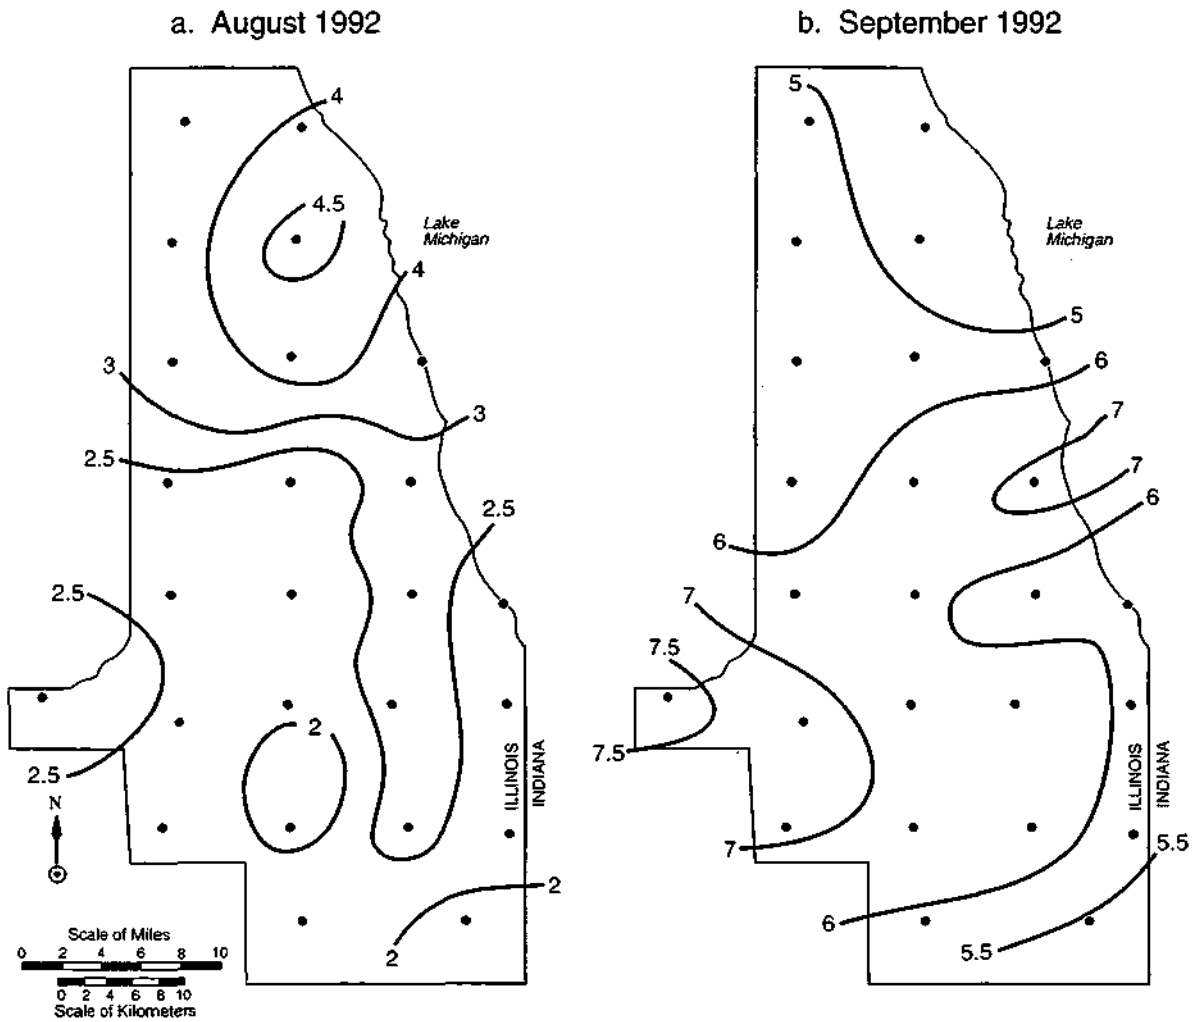

Figure 9. Precipitation pattern (inches) for August 1992 (Panel a) and September 1992 (Panel b). Dots indicate raingage sites.

Park) to 1.30 inches at Site #2 (Winnetka). For heavier precipitation, October values ranged from 6.92 inches at Site #1 (near Northbrook) to 10.03 inches at Site #17 (Alsip), the water year high. September was the second-wettest month, with values ranging from 4.55 inches at Site #4 (Skokie) to 7.80 inches at Site #15 (Lemont).

Of the 123 storms identified during Water Year 1992, six produced amounts that surpassed an annual event (one-year recurrence interval), for the given storm duration, considering storm durations of one hour to ten days in northeastern Illinois (values from Huff and Angel, 1989). These included Storms 2 and 8 in October, Storm 80 in June, Storm 97 in July, Storm 103 in August, and Storm 116 in September. Storms 2 (October 3-5, 1991, with durations ranging from 26 to 32 hours) and 116 (September 9, 1992, with durations ranging from 13 to 18 hours) were the heaviest over the entire network. At least 2.19 inches of precipitation fell at every site during Storm 2, while at least 1.11 inches fell at every site during Storm 116. During Storm 2, 15 sites had totals exceeding an annual event, while three sites had totals exceeding a 2-year event. During Storm 116, 17 sites had totals exceeding an annual event, seven had totals exceeding a 2-year event, six had totals exceeding a 5-year event, and two had totals exceeding a 10-year event. In this storm, Site #20 had the water year storm-high precipitation total (4.42 inches during a 13-hour period). Another storm total of note occurred during Storm 80 (June 17, 1992), when 2.78 inches fell at Site #10 during a 2-hour period, exceeding a 10-year event. Appendix IV lists all storm totals for all events greater than an annual event, considering storm periods of one hour to ten days in northeastern Illinois, with special notation given for storms exceeding events ranging from 2 to 100 years, respectively.

A comparison was also made between the unadjusted data from Water Years 1984-1985 and 1987-1989 (Figure 10) and network totals from Water Years 1990-1991 (Figure 11) and

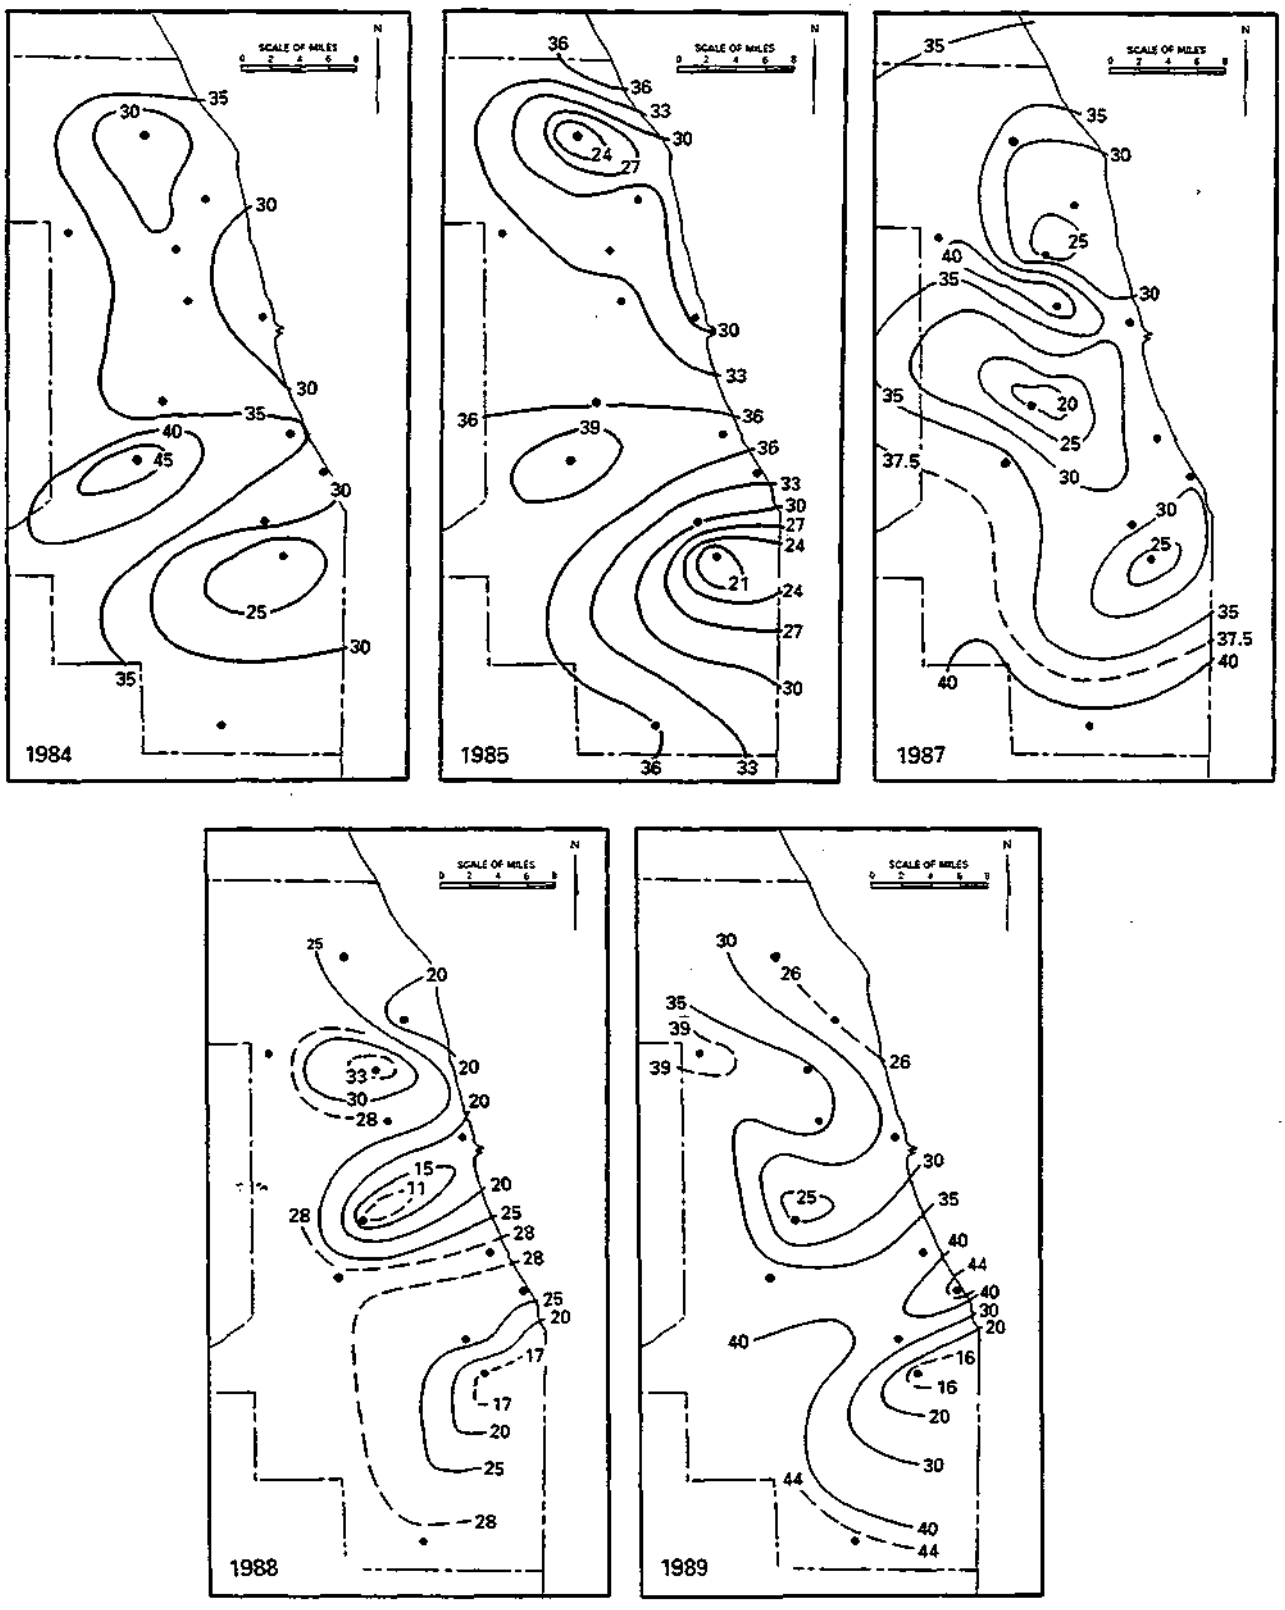

Figure 10. Unadjusted precipitation patterns (inches) for Water Years 1984-1985 and 1987-1989 from National Weather Service, City of Chicago, and Metropolitan Water Reclamation District of Greater Chicago raingages.

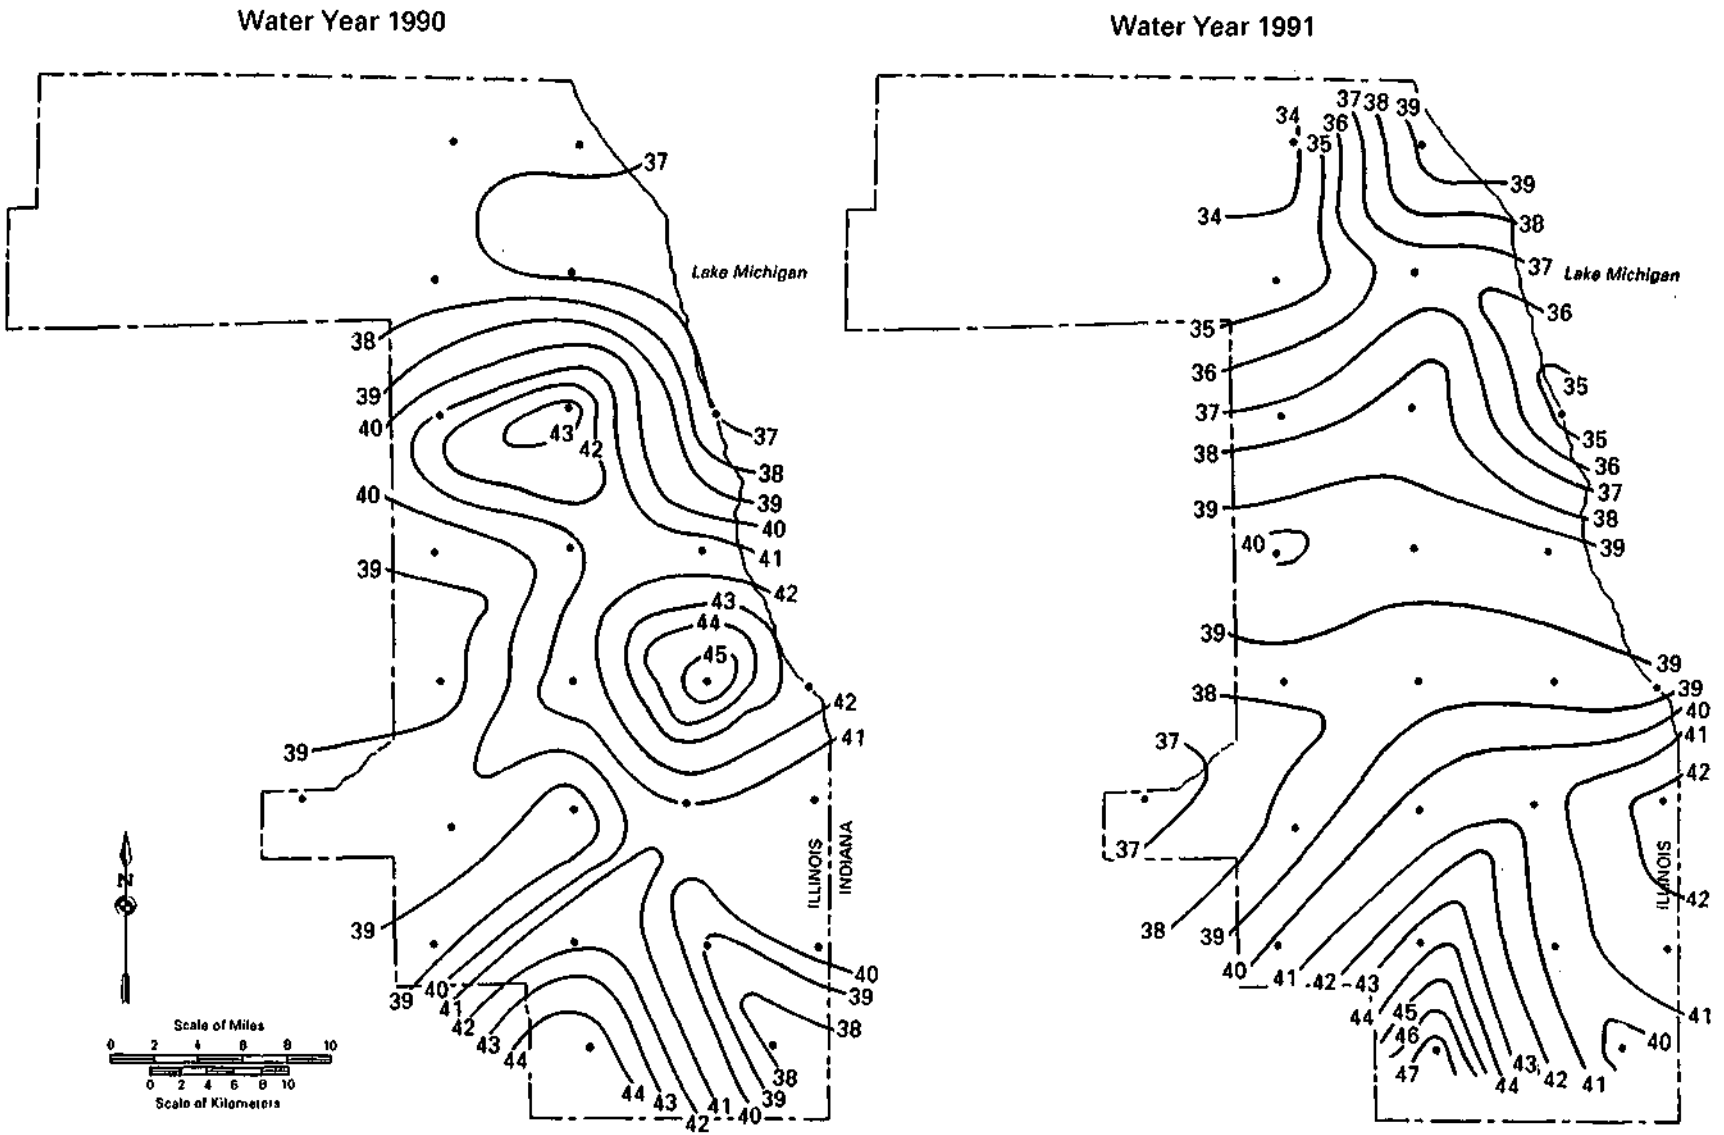

Figure 11. Precipitation pattern (inches) for Water Years 1990 and 1991 from network raingages.

1992 (Figure 3). Excluding the low values at the West Southwest Sewage Treatment Plant (an MWRDGC site in the center of the region - see Figure 1), which had many missing observations during Water Years 1987-1989, network patterns from 1990-1992 do not show the unusual, highly contrasting high/low patterns found in the 1984-1989 water year patterns given by the NWS, CC, and MWRDGC raingages. The current raingage network is continuing to measure the precipitation that falls over the Cook County region more consistently than the previously used NWS, CC, and MWRDGC gages were able to measure.

Finally, a composite 1990-1992 three-year network average analysis (Figure 12) shows a general north-to-south increase in precipitation across the network, with lows along the lakeshore north of downtown and in the northwestern and extreme southeastern portions of the grid, and highs in the north-central, east-central, and southern parts of the network.

6. SUMMARY

With collection, reduction, and analysis of precipitation data now complete for Water Years 1990-1992, the Cook County raingage network appears to be accurately capturing the precipitation that falls over the region. The network's exposure and areal coverage are superior to the previously used network of NWS, CC, and MWRDGC raingages. These data are greatly enhancing the ability of the U.S. Army Corps of Engineers, Chicago District, to properly assess the storm runoff portion of the diversion of waters from Lake Michigan. Also, because of the relatively dense spacing of the raingages, the continued operation of the network provides great potential for research on the precipitation climate of the Cook County region. Network operation has become routine enough to allow final hourly, daily, and monthly precipitation totals to be available within two weeks of the end of a calendar month.

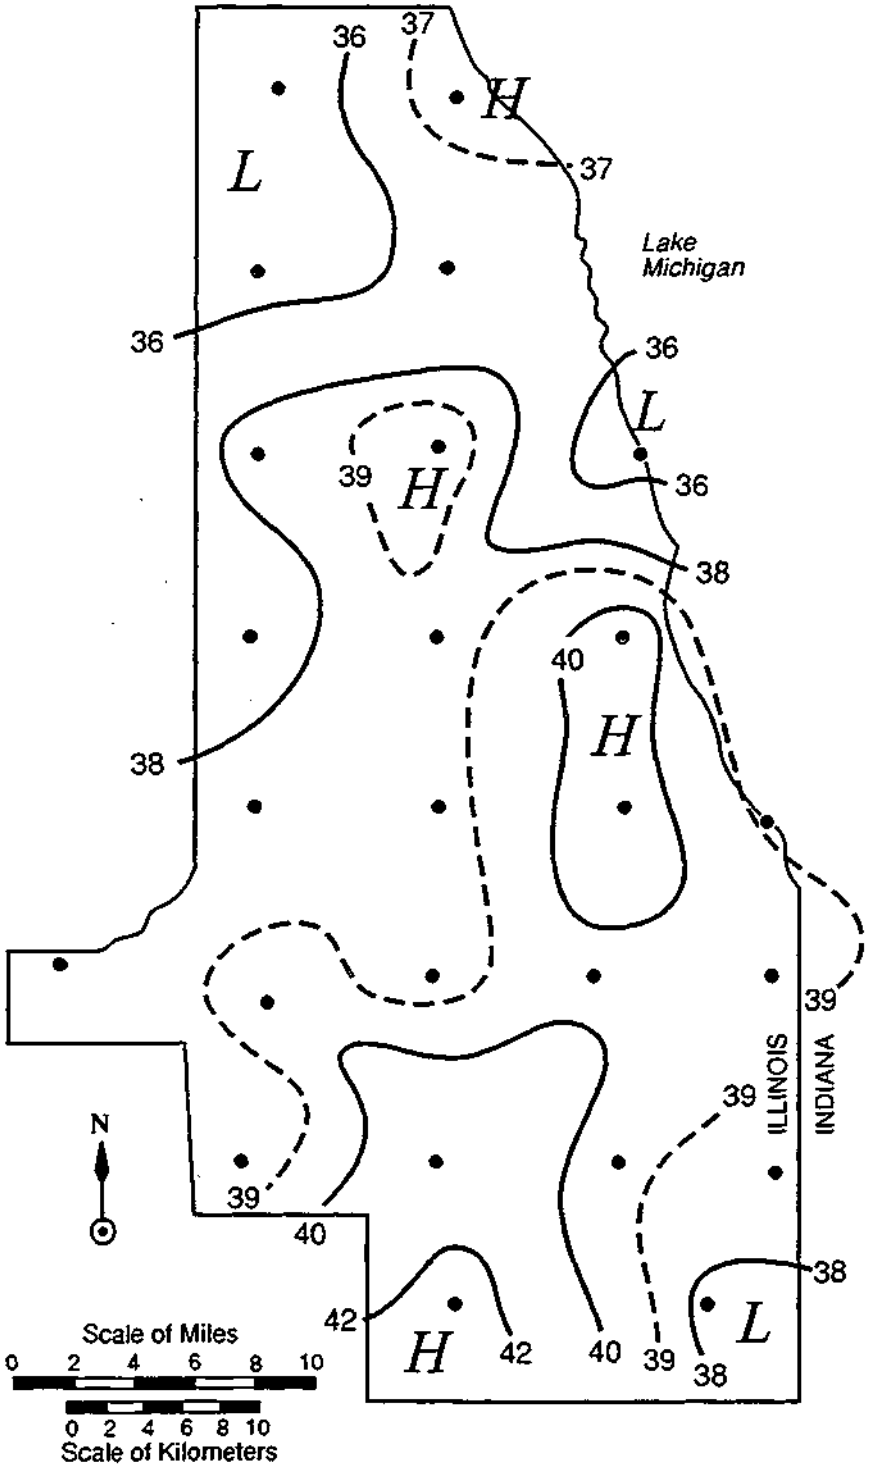

Figure 12. Three-year average precipitation pattern (inches) from Water Years 1990-1992.

7. ACKNOWLEDGMENTS

This work was contracted by the U.S. Army Corps of Engineers, Chicago District, under Grant DACW 23-89-C-0005. Tim Lormand and David Moughton, U.S. Army Corps of Engineers, Chicago District, administered the project, and Moughton also helped edit a draft version of the report. Doug Ward established the digitizing system, including software; Marv Clevenger and Roma Johnson handled all digitizing tasks; Linda Hascall drafted the figures; and Eva Kingston edited the report.

APPENDIX I: RAINGAGE SITE DESCRIPTIONS

Contained below are descriptions of the 25 raingage network sites representing the current siting in the Cook County, Illinois, region as of publication. Sites that have been relocated since the network began operation in October 1989 are noted in the "Placement" section of the descriptions.

SITE DESCRIPTION		
Site Number: 1		
County: Cook	Township: 42N	Range: 12E
Section: 20	Lat/Long: 42°06'38" / 87°52'05"	Quadrangle: Park Ridge
Property Owner: Mission Brook Sanitary District. Attn: John Tomaras		
Address: P.O. Box 2362. Northbrook. Illinois 60065		
Telephone: 708/272-2956		
Permission Date: September 14, 1989		
Installation Date: September 27. 1989		
Gage Mfrs. No.: 7378	Gage ID No.: 6561	Clock Mfrs. No.: E 7373
Placement: Southeast corner of pump station lawn at southwest corner of intersection of Post and Cornflower Streets. Tri-State Tollway fence is just to the west. Enter area from west at Landwehr Road (north of Willow Road) at Sunset Ridge.		

SITE DESCRIPTION		
Site Number: 2		
County: Cook	Township: 42N	Ranee: 13E
Section: 19	Lat/Long: 42°06'28" / 87°45'05"	Ouadrangle: Park Ridge
ProDertv Owner: Winnetka Park District. Attn: Richard Blust		
Address: 510 Green Bay Road, Winnetka. Illinois 60093		
Telephone: 708/446-2397		
Permission Date: September 14. 1989		
Installation Date: October 3. 1989		
Gage Mfrs. No.: 1703	Gage ID No.: 261	Clock Mfrs. No.: E 7629
Placement: Between maintenance building and parking lot in grassy area. Previously located 15 feet southeast in the maintenance yard (10-3-89 through 7-31-91) before the gage was destroyed. The facility closes at 1600 local time on workdays. Enter facility west off of Hibbard Street, north of Willow Road.		

SITE DESCRIPTION		
Site Number: 3		
County: Cook	Township: 41N	Range: 12E
Section: 28	Lat/Long: 42°01'20" / 87°52'38"	Ouadrangle: Arlington Heights
Property Owner: Private Residence		
Address: 1885 Riverview Avenue. Des Plaines, Illinois 60018		
Telephone: 708/824-1093		
Permission Date: September 14. 1989		
Installation Date: September 28. 1989		
Gage Mfrs. No.: 4730	Gage ID No.: 5062	Clock Mfrs. No.: E 7323
Placement: Northwest corner of the yard by the fence. Enter Riverview Avenue west off of Des Plaines River Road.		

SITE DESCRIPTION		
Site Number: 4		
County: Cook	Township: 4 IN	Range: 13 E
Section: 21	Lat/Long: 42°01'35" / 87°45'22"	Ouadrangle: Park Ridge
ProDertv Owner: Village of Skokie. Attn: Eddy Nakai		
Address: 5127 Oakton Street, Skokie, Illinois 60077		
Telephone: 708/673-0500		
Permission Date: September 18, 1989		
Installation Date: September 27. 1989		
Gage Mfrs. No.: 4656	Gage ID No.: 5040	Clock Mfrs. No.: E 7345
Placement: Grassv strip between municipal parking lot and Floral Street just north of Oakton Street (across from Village Hall). Enter from Oakton Street.		

SITE DESCRIPTION		
Site Number: 5		
County: Cook	Township: 40N	Range: 12E
Section: 28	Lat/Long: 41°55'57" / 87°52'42"	Quadrangle: Elmhurst
Property Owner: Private Residence		
Address: 2925 North Sarah Drive, Franklin Park, Illinois 60131		
Telephone: 708/455-1226		
Permission Date: September 13. 1989		
Installation Date: September 28. 1989		
Gage Mfrs. No.: 4717	Gage ID No.: 5105	Clock Mfrs. No.: E 7630
Placement: Northeast corner of backyard near a fence and a hedge. Enter Schiller Avenue east off of Mannheim Road, then south on Sarah Drive (one-way).		

SITE DESCRIPTION		
Site Number: 6		
County: Cook	Township: 40N	Range: 13E
Section: 28	Lat/Long: 41°56'17" / 87°45'38"	Ouadrangle: River Forest
Property Owner: Private Residence		
Address: 5340 West Fletcher Street, Chicago, Illinois 60641		
Telephone: 312/736-0106		
Permission Date: September 28. 1989		
Installation Date: September 28. 1989		
Gaee Mfrs. No.: 5300	Gage ID No.: 5304	Clock Mfrs. No.: E 7625
Placement: Middle of backyard along walkway halfway betvveen house and garage. Was closer to alley before garage was built (9-28-89 through 9-19-90). Enter alley east off of Long Street, which is south off of Belmont Avenue.		

SITE DESCRIPTION		
Site Number: 7		
County: Cook	Township: 40N	Range: 14E
Section: 21	Lat/Long: 41°57'07" / 87°38'24"	Ouadrangle: Chicago Loop
Property Owner: Broadway United Methodist Church. Attn: Pastor Fred Morris		
Address: 3344 North Broadway, Chicago. Illinois 60657		
Telephone: 312/348-2679		
Permission Date: October 4. 1991		
Installation Date: October 4. 1991		
Gage Mfrs. No.: 5281	Gage ID No.: 5303	Clock Mfrs. No.: E 7293
Placement: Just northeast of parking lot in grass strip between lot and black wrought iron fence. Enter parking lot from Buckingham Place (one-way westbound from Broadway). Was located at Belmont Harbor boat landing (10-1-89 through 12-27-89), on the Lincoln Park Gun Club roof (12-27-89 through 6-28-91), and just north of Diversey Harbor in a playground (6-28-91 through 10-4-91).		

SITE DESCRIPTION		
Site Number: 8		
County: Cook	Township: 39N	Range: 12E
Section: 29	Lat/Long: 41°50'41" / 87°52'51"	Ouadrangle: Hinsdale
Property Owner: Cook County Forest Preserve District. Attn: Frank Grippo		
Address: 10400 Windsor Drive. Westchester. Illinois 60154		
Telephone: 312/562-7628		
Permission Date: September 21. 1989		
Installation Date: September 27. 1989		
Gage Mfrs. No.: 4669	Gage ID No.: 5070	Clock Mfrs. No.: E 7392
Placement: Southeast corner of backyard between pool and grape hedge. Enter Windsor Drive east from Belleview Drive, south from Cermak Road and into Forest Preserve residence facility. Just west of Salt Creek and parallel bike trail.		

SITE DESCRIPTION		
Site Number: 9		
County: Cook	Township: 39E	Range: 13E
Section: 28	Lat/Long: 41°50'48" / 87°45'26"	Quadrangle: Berwyn
Property Owner: Mary Oueen of Heaven Parish, c/o Father John Price		
Address: 5314 West 24th Place, Cicero. Illinois 60650		
Telephone: 708/863-6608		
Permission Date: May 24, 1990		
Installation Date: Mav 24, 1990		
Gage Mfrs. No.: 7376	Gage ID No.: 6559	Clock Mfrs. No.: E 7419
Placement: Southwest corner of schoolyard about 12 feet from south fence line and along a west fence, west of the nunnery. Was located at 5530 West 24th Street (9-28-89 through 5-24-89). Enter 24th Place (one-way east) from Central Avenue, south from Cermak Road.		

SITE DESCRIPTION		
Site Number: 10		
County: Cook	Township: 39N	Ranee: 14E
Section: 28	Lat/Long: 41°50'42" / 87°38'27"	Ouadrangle: Englewood
Property Owner: Rental Residence		
Address: 527 West 26th Street, Chicago, Illinois 60616		
Telephone: 312/225-8066		
Permission Date: September 13, 1989		
Installation Date: September 28. 1989		
Gage Mfrs. No.: 4720	Gage ID No.: 5113	Clock Mfrs. No.: E 7416
Placement: Backyard near edge of walk north of a garage an d east of a spruce tree. Enter off of alley south of 26th Street, where locked gate is to be entered (observer keeps key). In Chinatown area, block between Wallace and Norma **l.**		

SITE DESCRIPTION		
Site Number: 11		
County: Cook	Township: 38N	Range: 12E
Section: 28	Lat/Lone: 41°45'30" / 87°52'18"	Quadrangle: Berwyn
Property Owner: Private Residence		
Address: 10180 5th Avenue Cutoff, LaGrange, Illinois 60525		
Telephone: 708/354-3161		
Permission Date: September 13. 1989		
Installation Date: September 29. 1989		
Gage Mfrs. No.: 3348	Gage ID No.: 4452	Clock Mfrs. No.: E7344
Placement: 6 feet east of clothesline pole in center of backyard near edge of a large garden. Access from Willow Springs Road, south of Joliet Road (parcel of land is between Interstate-55 and Tri-State Tollway).		

SITE DESCRIPTION		
Site Number: 12		
County: Cook	Township: 38N	Range: 13E
Section: 28	Lat/Lone: 41°45'29" / 87°45'08"	Ouadrangle: Berwvn
Property Owner: Reckitt & Coleman		
Address: 5151 West 73rd Street, Chicago, Illinois 60638		
Telephone: 708/594-1100		
Permission Date: September 13. 1989		
Installation Date: September 28. 1989		
Gage Mfrs. No.: 4661	Gage ID No.: 5111	Clock Mfrs. No.: E 7413
Placement: 50 feet southwest of truck scale platform in the third fenced-in area. Facility is locked on the weekend. Access from gate on 73rd Street (few blocks west of Cicero Avenue).		

SITE DESCRIPTION		
Site Number: 13		
County: Cook	Township: 38N	Range: 14E
Section: 28	Lat/Long: 41°45'34" / 87°38'07"	Quadrangle: Englewood
Property Owner: Private Residence		
Address: 7409 South Eggleston Street, Chicago, Illinois 60621		
Telephone: 312/224-3807		
Permission Date: September 13, 1989		
Installation Date: September 29. 1989		
Gage Mfrs. No.: 4687	Gage ID No.: 5058	Clock Mfrs. No.: E 7353
Placement: Northwest of concrete patio, 3 feet from 8-foot high chain-link fence. About the only secure location in the vicinity. Entry is through a locked garage gate (observer has key). Otherwise, ring upper bell at front door. Was placed east of barbecue pit, 4 feet from fence and 7 feet southeast of present location (9-29-89 through 8-23-90), and 10 feet west of that position (8-23-90 through 4-15-92). Enter South Eggleston Street from 74th Street.		

SITE DESCRIPTION		
Site Number: 14		
County: Cook	Township: 38N	Range: 15E
Section: 29	Lat/Long: 41°45'27" / 87°32'40"	Ouadrangle: Jackson Park
Property Owner: City of Chicago - South Water Purification Plant. Attn: Robert Sambol		
Address: 3300 East Chiltenham Place, Chicago, Illinois 60649		
Telephone: 312/933-7107		
Permission Date: September 12, 1989		
Installation Date: September 28. 1989		
Gage Mfrs. No.: 3370	Gage ID No.: 4453	Clock Mfrs. No.: E 7294
Placement: Center of large grassv area (turf-covered roof) over sand filtration beds. Two distant buildings are east and west of the site. Enter facility east off of 79th Street from South Shore Drive.		

SITE DESCRIPTION		
Site Number: 15		
County: Cook	Township: 37N	Ranee: HE
Section: 20	Lat/Long: 41°40'38" / 87°59'52"	Quadrangle: Sag Bridge
Property Owner: Metropolitan Water Reclamation District of Greater Chicago. Attn: Jim Ivers		
Address: 13 Stephen Street. Lemont. Illinois 60439		
Telephone: 708/257-7371		
Permission Date: September 11. 1989		
Installation Date: September 27. 1989		
Gage Mfrs. No.: 3373	Gage ID No.: 4421	Clock Mfrs. No.: E 7627
Placement: About 100 feet east of entrance road, and several hundred feet south of MWRDGC building. Just north of Illinois and Michigan Canal. Access from Stephen Street in downtown Lemont. Exit Interstate-55 south on Lemont Road and then downtown, or enter from east on McCarthy Road. Hours are 0700-1530 local time.		

SITE DESCRIPTION		
Site Number: 16		
County: Cook	Township: 37N	Range: 12E
Section: 28	Lat/Long: 41°39'47" / 87°52'14"	Quadrangle: Palos Park
Property Owner: Private Residence		
Address: 240 Timber Edge Lane, Palos Park. Illinois 60464		
Telephone: 708/361-0853		
Permission Date: September 11. 1989		
Installation Date: September 27. 1989		
Gage Mfrs. No.: 4733	Gage ID No.: 5022	Clock Mfrs. No.: E 7378
Placement: Along west edge of lawn in backvard, about 20 feet south of property line and utility. Was moved about 2 feet on 4-26-91 to facilitate landscaping. Enter subdivision from 125th Street (off of Route 45), just south of McCarthy Road. West-southwest of Papoose Lake.		

SITE DESCRIPTION		
Site Number: 17		
County: Cook	Township: 37N	Range: 13E
Section: 28	Lat/Long: 41°40'33" / 87°45'03"	Quadrangle: Palos Park
Property Owner: Sardee Industries, Attn: Andy Chakonas		
Address: 11900 South Laramie Street. Alsip. Illinois 60658		
Telephone: 708/597-7330		
Permission Date: September 11, 1989		
Installation Date: September 27. 1989		
GageMfrs. No.: 4719	Gage ID No.: 5415	Clock Mfrs. No.: E 7300
Placement: About 50 feet west of last loading dock in grassy field northwest of factory. Enter Laramie Street from 122nd Street, west of Cicero Avenue. Northeast of Tri-State Tollway, just south of Restvale Cemetery.		

SITE DESCRIPTION		
Site Number: 18		
County: Cook	Township: 37N	Range: 14E
Section: 29	Lat/Long: 41°40'35" / 87°39'06"	Quadrangle: Blue Island
Property Owner: Ingersoll Products Company, Attn: Don Recupido		
Address: 1000 West 120th Street, Chicago, Illinois 60643		
Telephone: 312/264-7800		
Permission Date: September 12, 1989		
Installation Date: September 27, 1989		
Gage Mfrs. No.: 7130	Gage ID No.: None	Clock Mfrs. No.: E 7410
Placement: Southwest end of property just southwest of a truck scale and east of property fence. Must enter at guarded gate on 119th Street.		

SITE DESCRIPTION		
Site Number: 19		
County: Cook	Township: 37N	Ranee: 15E
Section: 20	Lat/Long: 41°40'20" / 87°32'21"	Ouadrangle: Lake Calumet
Property Owner: Graycor Industries		
Address: 12233 Avenue O, Chicago, Illinois 60603		
Telephone: 312/221-8400		
Permission Date: September 11. 1989		
Installation Date: September 26. 1989		
Gage Mfrs. No.: 5298	Gage ID No.: 5291	Clock Mfrs. No.: E 7294
Placement: Grassv area just south of entrance drive and just west of the main parking lot. Office building and shops to north, and shops to southwest.		

SITE DESCRIPTION		
Site Number: 20		
County: Cook	Township: 36N	Range: 12E
Section: 29	Lat/Long: 41°35'08" / 87°52'37"	Ouadrangle: Mokena
Property Owner: Private Residence		
Address: 10595 West 167th Street, Orland Park, Illinois 60462		
Telephone: 708/349-9388		
Permission Date: March 16. 1990		
Installation Date: March 16. 1990		
Gage Mfrs. No.: 4667	Gage ID No.: 5061	Clock Mfrs. No.: E 7415
Placement: About 30 feet east of welding shop on rural property. Shop is east building of home/shop complex. Four dachshunds outside. Was located about 0.25 mile southeast on South 104th Avenue (9-26-89 through 3-16-90).		

SITE DESCRIPTION		
Site Number: 21

Installation Date: September 26. 1989		
Gage Mfrs. No.: 7573	Gage ID No.: WMU81122	Clock Mfrs. No.: E 7564
Placement: 5 feet west of telephone terminal box on grass north of parking lot and northeast of Matteson Police Department on Cicero Avenue, 0.5 mile north of U.S. 30.		

SITE DESCRIPTION		
Site Number: 25		
County: Cook	Township: 35N	Range: 14E
Section: 13	Lat/Long: 41°31'14" / 87°34'26"	Ouadrangle: Calumet City
Property Owner: Big John's Farm Stand, Attn: John DeBoer		
Address: 1754 East Joe Orr Road, Chicago Heights, Illinois 60411		
Telephone: 708/758-2711		
Permission Date: September 12,1989		
Installation Date: September 26, 1989		
Gage Mfrs. No.: 7467	Gage ID No.: WMU80955	Clock Mfrs. No.: E 7374
Placement: Northeast of farm stand parking lot, northwest of house and northeast of farm stand. Small ditch between parking lot and gage, and large trees near house. Just east of Interstate-394 and Stony Island Avenue, and west of Torrence Avenue.		

APPENDIX II: INSTRUCTIONS FOR RAINGAGE TECHNICIANS

1. Supplies required for proper servicing of the instruments in the Cook County raingage network:

a. A supply of 24-hour rotation raingage charts (Belfort number 5-4047-B)
b. A supply of spare felt-tipped pen points
c. A roll of paper towels or similar absorbent material
d. A ball-point pen or pencil
e. Grass clippers and/or sickle
f. A clipboard
g. A spare 12-quart bucket

2. Make sure you have the correct time in the Central Standard Time zone:

Please coordinate your watch with the broadcast tone from radio station WMAQ or WGN, etc., on the hour, before starting a day's servicing schedule, and recheck if possible when out in the field. Try to be within 15 seconds of the correct time.

3. Order of servicing upon arrival at a site (try to complete within 5-10 minutes of arrival):

1) Cut the grass around the raingage if necessary or applicable. Do this to the specifications of the landowner or below the level of the raingage door, whichever is shorter.

2) Open the sliding door on the side of the instrument case by pushing out on the hinge lock and pulling up on the door handle, depress the bucket platform upright casting to ink the OFF time on the chart (a vertical line). Note the time on your watch, and move the pen point and arm away from the chart by pushing out on the pen bracket. Lift up on the drum cylinder to disengage it from the electric chart drive, and remove it from the instrument case. Write the OFF date and time on the chart. Carefully remove the chart from the drum to avoid smearing the fresh ink at the end of the trace.

3) Write this OFF time as the ON time on a new chart, and apply it to the drum cylinder, making sure the crease at the right end of the chart is sharp and the chart is tight on the cylinder. This helps prevent skipping when the pen point travels over the drum clip, as well as preventing false indications of a rain event. Make a small mark with your pen or pencil on the chart near the zero-inch line to indicate the ON time. Try to match the chart reading with the ON time as closely as possible. Reinstall the chart cylinder onto the electric chart drive, making sure the chart cylinder and drive gears mesh.

4) Quickly remove the collector from the top of the gage by rotating the collector clockwise to disengage the tongue-and-groove assembly, set it down, and then carefully lift the bucket off of the weighing platform (if there is water in it) and dump the water on the ground. Reposition the bucket on the platform and reinstall the collector by setting it on top of the raingage case and turning counterclockwise until the tongue-and-groove assembly meshes. During wintertime operation when a charge of antifreeze is in the bucket, leave the antifreeze until the chart reading passes the 6-inch mark. At that point, dump the bucket contents into a large plastic bucket and dispose of properly. DO NOT POUR SOLUTION ONTO THE GROUND! If wintertime conditions prevail, recharge the empty bucket with a quart of antifreeze. At any time of the year, once the collector is repositioned, check the gage to make sure the collector orifice top edge is level. With a level positioned on the collector orifice, depress the stakes on the side(s) reading high with your shoe or boot, lightly or firmly depending on how much out of level the gage is and how soft the ground is.

5) Move the pen arm and point over near the chart cylinder and rotate the cylinder counterclockwise until the pen point coincides with the pencil mark on the chart denoting the ON time. Let the pen point rest on the chart there, and depress the platform casting again to make a vertical pen line at the ON time. This also assures that the pen point is writing correctly. If not, check the tip of the pen point to see why it is not drawing. Replace if necessary. It helps if the word "ON" is written on the chart near the ON line for later chart editing purposes. Rezero the pen point if necessary by turning the fine adjustment screw. It isn't a bad idea to "zero" the pen near the 0.25-inch mark instead to prevent evaporation from taking the pen point below the zero line.

6) Wipe the inside base of the gage to keep it relatively clean. Check the just-removed chart for any irregularities and note them on the upper right corner. As you are doing this, keep an eye on the new chart to make sure the drum is rotating and the pen is writing. When you are sure everything is operating correctly, carefully close the gage door and push the hinge lock in to secure it. Make sure you have removed all supplies and tools from the site before moving on to the next one.

4. Completed raingage charts and site repairs:

When a complete set of 25 charts has been collected for a week, place them in numerical order, put them in one of the postage-paid envelopes provided, and mail them to the State Water Survey, noting the name of the project director on the envelope. If any serious problems were encountered during servicing, please call the project director "collect" to relay the information to him. Situations worthy of immediate attention include chart-drive stoppages, unauthorized movement of the raingage, vandalism, and theft. Repairs will then be scheduled as soon as possible. Make minor repairs (e.g., pen point stuck under drum cylinder, debris in the collection bucket, etc.). Major repairs will require the attention of the State Water Survey.

5. Change in site status:

If you become aware that there has been or will be a change of status of one of the sites in the network, or one of the landowners requests movement of the raingage, please alert the State Water Survey immediately so that the project director can contact the landowner to work out a new arrangement. It is important to try to keep the sites as permanent as possible during the course of this project.

6. Public relations:

As a representative of the State of Illinois, it is imperative that you make your contacts with the landowners and others as cordial as possible and respect their property. They are providing an important service by agreeing to have the instrumentation on their property, so please keep their good will. Refer any questions from them concerning the project and your job that you are unable to answer to the project director.

APPENDIX III: DOCUMENTATION OF RAINGAGE MAINTENANCE

This appendix gives complete documentation of all maintenance work carried out at each of the sites in the raingage network during Water Year 1992, including visits when no action was taken. Organized chronologically by site number, this documentation is current through September 30, 1992. The capillary well pen points (and associated ink) were replaced with felt-tipped pens at all sites in June 1992. These new pens have worked very well, and will continue to be used. All gages were cleaned, lubricated, and recalibrated on August 17-18, 1992. Any special attention given to specific gages on those days is noted. Sites with no entries listed did not require servicing other than during the August 17-18, 1992, calibration visit.

SITE#1: MISSION BROOK SANITARY DISTRICT

10-4-91: Replaced collector, outer case, chart drive, and pen point, releveled gage.

11-1-91: Releveled gage, adjusted pen arm.

1-22-92: Releveled gage, rezeroed pen point, replaced chart drive.

6-26-92: Replaced outer case.

SITE #2: WINNETKA PARK DISTRICT

6-26-92: Releveled gage, replaced chart drive batteries.

SITE #3: DES PLAINES

10-4-91: Replaced outer case.

11-1-91: Releveled gage, replaced chart drive.

6-26-92: Replaced chart drive batteries.

8-18-92: Replaced chart drive.

SITE #4: VILLAGE OF SKOKIE

10-4-91: Replaced chart drive batteries.

11-1-91: Releveled gage, replaced chart drive.

6-26-92: Replaced outer case.

SITE #5: FRANKLIN PARK

1-22-92: Replaced pen point, replaced chart drive.

6-26-92: No action, but received word that homeowner had died. Home is vacant, but is being maintained by relatives.

SITE #6: WEST FLETCHER STREET

SITE #7: BROADWAY UNITED METHODIST CHURCH

10-4-91: Installed new gage at Broadway United Methodist Church, about 0.5 mile northwest of previous location. Removed vandalized gage from Chicago Park District property. New location is in a secure, secluded grassy area.

4-15-92: Replaced chart drive batteries.

SITE #8: COOK COUNTY FOREST PRESERVE DISTRICT - WESTCHESTER

1-22-92: Releveled gage, replaced chart drive batteries.

4-15-92: Replaced chart drive batteries.

6-26-92: Replaced collector, tightened outer case.

SITE #9: MARY QUEEN OF HEAVEN PARISH - CICERO

10-4-91: Replaced chart drive, shortened chart clip, releveled gage.

11-1-91: Releveled gage, replaced chart drive batteries, replaced outer case and collector.

1-22-92: Releveled gage.

4-15-92: Releveled gage, replaced chart drive batteries.

6-26-92: Replaced chart drive batteries.

SITE #10: WEST 26th STREET

SITE #11: LA GRANGE

10-4-91: Replaced chart drive, shortened chart clip.

4-15-92: Replaced chart drive batteries.

SITE #12: RECKITT & COLEMAN - 73rd STREET

4-15-92: Releveled gage, replaced chart drive, adjusted pen arm. Discovered that Boyle Midway sold to Reckitt & Coleman.

8-18-92: Releveled gage.

SITE #13: SOUTH EGGLESTON AVENUE

4-15-92: Moved gage approximately 10 feet west of previous location, still within backyard, at homeowner's request.

SITE #14: SOUTH WATER PURIFICATION PLANT

SITE #15: MWRDGC - LEMONT

6-26-92: Replaced chart drive. New construction at MWRD-Lemont causing excess traffic by service vehicles and heavy equipment near raingage.

SITE #16: PALOS PARK

4-15-92: Releveled gage, replaced chart drive.

6-26-92: Replaced chart drive.

SITE #17: SARDEE INDUSTRIES - ALSIP

11-1-91: Releveled gage.

8-17-92: Replaced chart drive batteries.

SITE #18: INGERSOLL PRODUCTS - WEST 120th STREET

SITE #19: GRAYCOR INDUSTRIES - AVENUE O

1-22-92: Replaced chart drive batteries.

SITE #20: ORLAND PARK

1-22-92: Releveled gage, replaced chart drive batteries.

4-15-92: Releveled gage, replaced chart drive.

6-26-92: Releveled gage, replaced chart drive batteries, replaced outer case.

8-17-92: Replaced chart drive.

SITE #21: TINLEY PARK

11-1-91: Replaced chart drive.

4-15-92: Releveled gage, replaced chart drive batteries.

SITE #22: U.S. ARMY RESERVE CENTER - HARVEY

11-1-91: Releveled gage, replaced pen point.

4-15-92: Releveled gage.

SITE #23: CITY OF LANSING PUBLIC WORKS

8-17-92: New recycling building constructed 75 feet west of gage.

SITE #24: VILLAGE OF MATTESON

10-4-91: Replaced collector, releveled gage.

4-15-92: Releveled gage, replaced chart drive batteries.

6-26-92: Releveled gage, replaced collector, replaced chart drive batteries.

8-17-92: Releveled gage.

SITE #25: BIG JOHN'S FARM STAND - CHICAGO HEIGHTS

11-1-91: Releveled gage.

1-22-92: Releveled gage, replaced chart drive, rezeroed pen point.

8-17-92: Replaced chart drive batteries.

APPENDIX IV: DOCUMENTATION OF HIGH STORM TOTALS

This appendix documents all storm totals that exceeded an annual event (one-year recurrence interval) during Water Year 1992. Storm durations of one hour to ten days were considered. The rainfall amounts for a one-year recurrence interval and the aforementioned storm durations in northeastern Illinois are given below (Huff and Angel, 1989).

Storm Duration	Rainfall Amounts (inches)
1 hour	1.18
2 hours	1.48
3 hours	1.60
6 hours	1.88
12 hours	2.18
18 hours	2.30
24 hours	2.51
48 hours	2.70
72 hours	2.93
5 days	3.25
10 days	4.12

The values listed in the following table exceed the numbers above for the given storm duration. An "E" indicates a partial or full estimate for a particular site and storm. The last column indicates whether a particular storm during the water year exceeded other events greater than an annual event (2-year to 100-year recurrence intervals considered).

STORM TOTALS

Storm #	Site *ft*	Date	Duration (hours)	Amount (inches)	Other Events Exceeded
2	1	10/3-5/91	29	2.76 E	
	2		32	3.02	
	3		28	2.72	
	4		28	3.13	2-year
	5		28	3.15	2-year
	6		28	2.84	
	8		28	2.79	
	11		29	2.62	
	14		29	2.74	
	16		28	2.58	
	18		28	2.90	
	19		27	2.63	
	21		26	2.83	
	22		27	2.80	
	24		27	3.15	2-year
8	4	10/24-25/91	15	2.27	
	11		16	2.36	
	15		17	2.47	
80	10	6/17/92	2	2.78	10-year
	11		4	1.87	
	12		4	1.95	
	13		4	1.90	
97	12	7/18/92	4	1.71	
103	2	8/2/92	1	1.19	
116	8	9/9/92	15	2.50 E	
	9		15	2.47	
	11		15	3.08	2-year
	12		14	2.97	2-year
	13		13	2.83	2-year
	14		14	2.87	2-year
	15		14	3.97	10-year
	16		17	3.89	5-year
	17		13	3.74	5-year
	18		14	3.48	5-year

STORM TOTALS (Concluded)

Storm #	Site#	Date	Duration (hours)	Amount (inches)	Other Events Exceeded
116	19	9/9/92	14	3.26	2-year
	20		13	4.42	10-year
	21		14	3.94	5-year
	22		14	3.74	5-year
	23		18	3.66	5-year
	24		17	3.30	2-year
	25		16	3.03	2-year
